# DHL GLOBAL CONNECTEDNESS REPORT 2026

An in-depth analysis of the state of globalization

**Steven A. Altman**

is a Senior Research Scholar at the New York University Stern School of Business and a Research Assistant Professor in NYU Stern's Department of Management and Organizations. Professor Altman is also Director of the DHL Initiative on Globalization at NYU Stern's Center for the Future of Management. His research focuses on globalization and its implications for business strategy and public policy. He holds a PhD from the University of Reading, an MBA from the Harvard Business School, an MPA from Harvard's John F. Kennedy School of Government, and a BS in Economics from the Wharton School of Business at the University of Pennsylvania.

**Caroline R. Bastian**

is a Senior Research Scholar at the New York University Stern School of Business. Ms. Bastian is based in the school's DHL Initiative on Globalization at its Center for the Future of Management. She coordinates the initiative's work on data science, statistics, quantitative methods, and data visualization. Ms. Bastian holds an MS in Applied Statistics for Social Science Research from New York University, a Master of International Affairs from Columbia University, and a BA from Pacific University.

## DEAR READER,

At first glance, the world seems to be pulling apart. But our daily operations across 220 countries and territories tell another story. As the world's largest logistics provider, we see supply chains adjusting, rerouting, and expanding in real time. The world is not disconnecting—it is evolving its connections.

We are, however, in a period of profound geopolitical and economic uncertainty. The rules-based order is under strain, and volatility has become part of daily decision-making for governments and companies alike. In such an environment, assumptions can be misleading—and facts matter more than ever.

The DHL Global Connectedness Report provides those facts. Now in its fifteenth year, it analyzes more than nine million data points to offer the most comprehensive view of globalization available today.

Despite persistent pressures, this year's findings offer reassurance: globalization is not reversing. It is reshaping and rebalancing, while remaining at a historically high level. Countries and companies continue to adapt with remarkable resilience.

Global trade, for example, grew faster in 2025 than in any year since 2017, excluding the rebound after trade plummeted during the Covid-19 pandemic. Supply chains are extending, too—with traded goods crossing the longest average distances ever recorded. While recent U.S. tariff increases may temper growth in 2026, global goods trade is still projected to expand at an average annual rate of 2.6 percent through 2029, in line with the past decade.

We also see renewed momentum in trade agreements around the world—many of which would have seemed unlikely only a few years ago. Even in turbulent times, cooperation continues.

Looking ahead, I remain confident in the strength of global flows. Businesses and economies are learning to navigate uncertainty with greater resilience, supported by new technologies and more flexible supply chains. The challenges we face—from geopolitical tension to climate change—are undeniably complex. But they are also shared. Solving them will require cooperation, innovation, and a willingness to stay connected, even when the environment feels fragmented. A more connected world is not guaranteed—but it is essential for progress.

I hope you find this report both insightful and useful.

Tobias Meyer  
CEO, DHL Group

**DEAR READER,**

This edition of the DHL Global Connectedness Report offers a unique contribution at a time of great stress and turbulence in the international environment. Amid dramatic swings in politics and public policy, it provides the most comprehensive available assessment of the actual flows of trade, capital, information, and people connecting countries around the world. This year's findings strongly challenge the notion that the world has entered a period of deglobalization.

The latest data reveal no meaningful shift from international to domestic activity, and show international flows now occurring over the longest average distances on record. While there is some evidence of international flows more closely following countries' geopolitical positions, these changes remain modest in the global context. The more pronounced shifts are in the international engagement of countries at the center of current geopolitical tensions. In short, the world has become more complex and volatile, but not less interconnected.

In a complex and rapidly changing world, timely data and analysis are essential. At [dhl.com/globalconnectedness](https://dhl.com/globalconnectedness), many of the analyses presented in this report can be customized by country and flow type. Visitors can also download charts and data, and access the DHL Global Connectedness Tracker for timely updates ahead of our next full report.

I am grateful to Caroline Bastian, who has coauthored this report and every edition since 2018. Her insights and analytical contributions have substantially strengthened this body of work. We also continue to build on DHL Global Connectedness Index co-creator Pankaj Ghemawat's profound insights on the strengths and limits of globalization.

My sincere thanks also to Mathias Schneider for his steadfast and insightful collaboration on the development of this publication, to Sage Ahmed-Torres and Yogarajalakshmi Sathyanarayanan for their many contributions to the research reported here, to Ari Van Assche, Sinziana Dorobantu, Thomas Hout, Mahinthan Joseph Mariasingham, and Niccolò Pisani for reviewing preliminary drafts, to Jonathan Wyss for excellent cartography, to Björn Schuman for editorial support, to Dirk Hrdina for turning our text and graphics into a compelling visual product, and to Robin Wurl and Marshall Krinitz of the NYU Stern Center for Research Computing for supporting our team's data and computational resource requirements.

Finally, I would like to thank DHL Group for its longstanding support of our research and its sponsorship of the DHL Initiative on Globalization at NYU Stern's Center for the Future of Management. Our research initiative aims to be a leading center of excellence for data-driven globalization research. To learn more about our work, please visit our website at [stern.nyu.edu/globalization](https://stern.nyu.edu/globalization).

Steven A. Altman  
Senior Research Scholar and Director of the  
DHL Initiative on Globalization, NYU Stern

## 10 KEY TAKEAWAYS

1

**Global connectedness remains stable.** The DHL Global Connectedness Index does not indicate a shift from international to domestic activity across trade, capital, information, and people flows. Global connectedness reached a record high in 2022 and has not changed appreciably through 2025.

2

**Goods trade grew faster in 2025** than in any year since 2017, excluding the volatile Covid-19 pandemic period. U.S. buyers rushed to import goods ahead of tariff hikes, China increased exports to non-U.S. destinations, and investment in AI infrastructure boosted trade in goods such as semiconductors and data transmission equipment.

3

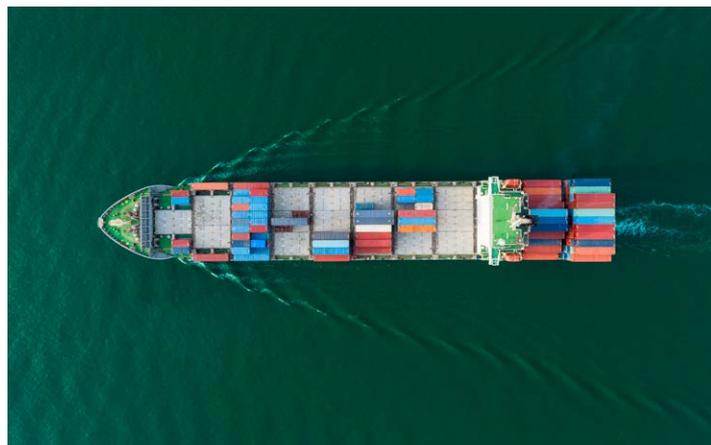

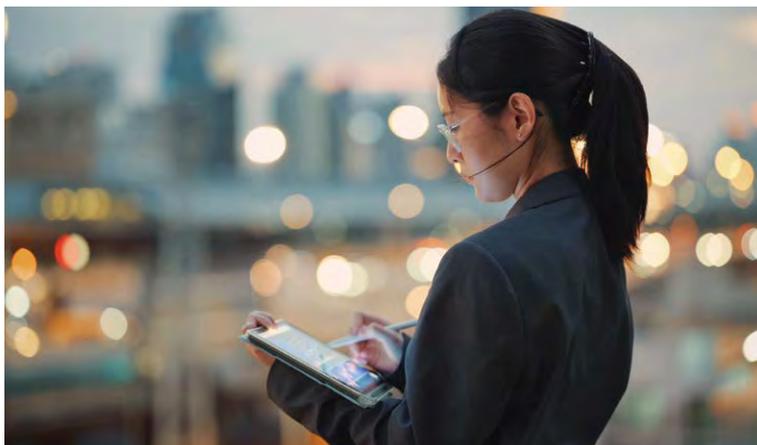

**Trade growth is forecast to continue** over the 2026–29 period at the same average pace as during the past decade. U.S. tariff increases only modestly reduced forecast global trade growth. Other countries supported trade growth by not raising tariffs, and many negotiated new trade deals to secure access to alternative markets.

4

**U.S.–China ties continue to diminish.** Since 2016, the share of U.S. trade, capital, information, and people flows with China has dropped 42%, while China’s share with the U.S. is down 37%. However, close allies of the U.S. and China (excluding Russia) show no similar pattern of decoupling from geopolitical rivals.

5

**The share of U.S. imports coming directly from China has fallen** from a peak of 22% in 2017 to 13% in 2024, before plummeting further to only 9% during the first three quarters of 2025. Nonetheless, analysis considering Chinese inputs in goods imported from other countries does not show a clear declining trend in U.S. reliance on content from China.

**6** **The world remains far from a split into disconnected geopolitical blocs.** Only 4-6% of global goods trade, greenfield FDI, and cross-border M&A have shifted away from geopolitical rivals over the past decade. Trade flows shifted more toward neutral countries than to close allies, implying more ‘de-risking’ than ‘friendshoring’.

**7** **Most international business already occurs among friendly countries,** limiting the threat de-risking strategies pose to globalization. In 2025, only 12% of global goods trade, 5% of greenfield FDI, and 3% of cross-border M&A took place between U.S.-aligned and China-aligned blocs of close allies.

**8** **Goods trade and greenfield FDI crossed their longest average distances on record in 2025,** while the shares of these flows occurring within major geographic regions fell to new lows. It remains to be seen whether nearshoring strategies will ultimately lead to more regionalized business patterns.

**9** **Singapore is the world’s most globally connected country,** followed by Luxembourg and the Netherlands. Singapore has the largest international flows relative to domestic activity, and the United Kingdom has the most broadly distributed flows around the world. The United Arab Emirates achieved the largest increase in global connectedness since 2001.

**10** **Prominent narratives about deglobalization** are driven more by politics and public policy than by actual shifts in cross-border flows. While the risk of deglobalization has risen and the pattern of connectedness is shifting, the world overall remains as connected as ever.

# EXECUTIVE SUMMARY

**This edition of the DHL Global Connectedness Report arrives at a moment of great turbulence in international relations. Amid dramatic policy shifts and high uncertainty, the analysis in this report shows that the flows of trade, capital, information, and people connecting countries around the world continue to show remarkable resilience. Deglobalization is a clear risk, but at least for now, the world's connectedness is holding steady at a historically high level.**

Since 2011, the DHL Global Connectedness reports have assessed the state and trajectory of globalization using hard data that tracks flows of trade, capital, information, and people around the world. This edition draws on more than 9 million data points on country-to-country flows to examine global trends and rank 180 countries by their levels of connectedness.

Our global trends analysis addresses three core questions in today's debates about a potential reversal of globalization: Are global flows still growing? Is geopolitical rivalry fracturing the world economy? Are international flows becoming more regional?

## **Are global flows still growing?**

The latest data from the DHL Global Connectedness Index shows the growth of global flows keeping pace with the growth of domestic activity, which means the share of activity crossing national borders remains stable. International flows reached a record high relative to domestic activity in 2022, and this balance has not changed meaningfully since then.

Global goods trade grew faster in 2025 than in any year since 2017, excluding the volatile Covid-19 pandemic period.<sup>1</sup> U.S. importers rushed goods into the country early in the year to beat tariff increases, and buoyant exports from China to other countries supported trade growth even after U.S. imports fell below prior-year levels later in the year. Trade in AI-related goods surged amid a race to build out AI infrastructure around the world (driving 42% of goods trade growth over the first three quarters of 2025).<sup>2</sup>

Looking ahead, higher U.S. tariffs are expected to dampen trade growth, particularly in 2026 (forecast growth for this year was downgraded from 3.3% to 2.6%).<sup>3</sup> Nonetheless, global goods trade is still projected to grow at roughly the same pace during 2026–29 as it did over the preceding decade (2.6% on average). Global trade can continue to grow despite U.S. tariff hikes because most trade does not involve the U.S. (13% of imports went to the U.S. in 2025 and 9% of exports came from the U.S.) and most other countries are not raising their own tariffs.<sup>4</sup> Instead, many countries are striking new trade agreements to secure access to alternative markets.

The latest data on international investment show mixed trends in 2025, with stronger results for foreign direct investment (FDI) flows and M&A deals than for greenfield FDI announcements.<sup>5</sup> Overall, companies continue to invest in foreign markets in line with historical trends. The share of cross-border M&A transactions, for example, has remained steady. This reflects the broader resilience of global business, as companies continue to conduct close to the highest recorded shares of their activity outside their home markets.

The globalization of information flows—the fastest-growing aspect of globalization over the past two decades—has largely plateaued since 2021. International patenting has slowed, and cross-border scientific collaboration and foreign IP licensing have recently declined. Geopolitical tensions and policy restrictions on international data flows may be starting to meaningfully constrain this aspect of globalization.

International flows of people have now recovered fully from sharp declines during the Covid-19 pandemic. Long-term rising trends prevail across international tourism, student mobility, and migration.<sup>6</sup>

While there has not been a clear shift away from international activity, the data continue to show that most flows happen within rather than between countries. The DHL Global Connectedness Index measures the balance of international versus domestic activity on a scale running from 0% (no flows cross national borders at all) to 100% (national borders and cross-country distances pose no constraints to

international flows). The latest reading is only 25%, which means we are still closer to a world of separate economies than to a fully—or even mostly—globalized world.

### **Is geopolitical rivalry fracturing the world economy?**

Increasing tensions between superpower rivals and continuing conflicts pose a genuine threat to globalization. Peace and security are vital enablers of international exchange, and mutually beneficial interdependence can be ‘weaponized’ to harm a country’s interests. Several studies point to early signs of economic fragmentation, with flows increasingly shaped by geopolitical considerations.<sup>7</sup> Still, the extent of such fragmentation remains limited at the global level.

A decoupling trend is underway between the U.S. and China, and the Ukraine war has shattered ties between the European Union and Russia. Since 2016, the share of U.S. trade, capital, information, and people flows with China has dropped from 9.3% to 5.4% (a 42% decline), while China’s share with the U.S. has fallen from 17.7% to 11.2% (a 37% drop). Flows between the EU and Russia have declined even more sharply since the full-scale invasion of Ukraine in 2022.

Such shifts, however, have redirected only a small share of global flows, and current data do not indicate a broader split of the world economy into disconnected geopolitical blocs. Direct trade between the U.S. and China has fallen from a peak of 3.6% of global trade in 2015 to only 2.0% in 2025 (based on data through September), and trade between rival blocs of “close allies” of the U.S. and China has fallen from 12.6% to 10.2% of world trade over the same period.<sup>8</sup> That means about 4% of global trade has shifted away from geopolitical rivals so far.<sup>9</sup>

Prevailing trends caution against assuming a major split of the world economy along geopolitical lines. While the average geopolitical distance (measured based on UN voting patterns) traversed by goods trade flows did fall in 2022–23 after Russia’s full-scale invasion of Ukraine, this trend did not continue through 2025.<sup>10</sup> Meanwhile, there is a rising trend in the geopolitical distance crossed by announced greenfield FDI since the Covid-19 pandemic. Recent shifts are also more

consistent with ‘de-risking’ than ‘friendshoring’—less trade between adversaries but more with neutral countries rather than close allies.

Moreover, most international business already occurs among friendly or neutral countries, suggesting that de-risking poses a smaller threat to globalization than many presume. In 2025, only 12.2% of trade flowed between the U.S. and China or their close allies, and cross-border investment between geopolitical rivals was even lower: just 5.1% of greenfield FDI and 3.5% of M&A deals.

New analysis in this report underscores the general stability of global business patterns by tracking year-to-year shifts in the shares of flows each country conducts with every other country.<sup>11</sup> Global trade patterns shifted more in 2025 than they do in a typical year but less than they did during prior disruptions such as the early stages of the war in Ukraine and the 2008–09 global financial crisis. Meanwhile, greenfield FDI patterns changed about as much as they do in an average year, and international M&A patterns shifted less than they usually do.

The biggest exception was the U.S., where trade patterns shifted at more than twice their normal rate in 2025—and more than in any other year in an analysis extending back to 2001. The share of U.S. imports coming directly from China plummeted from 13% in 2024 to 9% in 2025 (on top of prior declines from a peak of 22% in 2017). Indirect imports, however, have increased. Analysis through 2024 that takes into account Chinese materials and components going into goods the U.S. imports from other countries does not show a clear declining trend in the share of China-origin content consumed in the U.S.<sup>12</sup>

### **Are international flows becoming more regional?**

There is no robust evidence that international flows are becoming more regional. In fact, most types of cross-border activity have become less regional. On average, across all trade, capital, information, and people flows measured on the DHL Global Connectedness Index, the share occurring within major world regions fell to a record low in 2023 and

## COUNTRY RANKING HIGHLIGHTS

### WORLD'S MOST GLOBALLY CONNECTED COUNTRIES

-  1. Singapore
-  2. Luxembourg
-  3. Netherlands
-  4. Ireland
-  5. Switzerland
-  6. Hong Kong SAR, China
-  7. United Arab Emirates
-  8. Belgium
-  9. United Kingdom
-  10. Denmark

### COUNTRIES WITH LARGEST CONNECTEDNESS INCREASES SINCE 2001

-  1. United Arab Emirates
-  2. Namibia
-  3. Lao PDR
-  4. Albania
-  5. Mozambique
-  6. Singapore
-  7. Slovenia
-  8. Libya
-  9. Viet Nam
-  10. Qatar

### COUNTRIES WITH LARGEST INTERNATIONAL FLOWS RELATIVE TO DOMESTIC ACTIVITY

-  1. Singapore
-  2. Luxembourg
-  3. Hong Kong SAR, China
-  4. Ireland
-  5. United Arab Emirates
-  6. Malta
-  7. Netherlands
-  8. Cyprus
-  9. Belgium
-  10. Seychelles

### COUNTRIES WITH BROADEST GEOGRAPHIC REACH OF INTERNATIONAL FLOWS

-  1. United Kingdom
-  2. United States
-  3. Netherlands
-  4. Switzerland
-  5. Israel
-  6. France
-  7. Italy
-  8. Germany
-  9. Japan
-  10. Australia

remained at roughly the same level in 2024 (the most recent year available for all flows).

Additional evidence against rising regionalization comes from the average distance traversed by international flows. If international activity were becoming more regional, distances would be shrinking. Instead, the average distance traversed by the flows on the DHL Global Connectedness Index reached a record high in 2024. Data already available for 2025 reinforce this pattern: goods trade and announced greenfield FDI both traversed record distances, while the shares of these flows taking place within regions fell to new lows.

While the data do not show rising regionalization, it is important to keep in mind that international flows are already highly regionalized. Roughly half of global trade, capital, information, and people flows occur within major world regions—about three times more than would be expected in a world unconstrained by distance or differences between countries.

Whether international flows will become more regional in the future remains uncertain. Many companies and governments are working to foster regional supply chains, and such reconfigurations can take years to implement. Friendshoring could also lead to nearshoring, because countries that are close geographically also tend to be more closely aligned geopolitically. Still, nearshoring often entails trade-offs, and flows are already highly regionalized, which limits the scope for further increases.

---

The resilience of international flows stands in stark contrast to the widespread narrative that globalization is going into reverse. This gap between the globalization data and globalization headlines is largely due to the fact that much of the deglobalization discourse is driven not by actual cross-border flows but by shifts in politics and public opinion, policy changes, plans by companies to adjust markets or supply chains, and predictions about the future.<sup>13</sup> These signals help understand the likelihood of deglobalization, but they do not tell us whether the world is, in fact, becoming less connected.

In addition, several common errors and biases often inflate perceptions of deglobalization while underemphasizing the resilience of international flows. These include assuming that trends in major economies (U.S., China) or strategic industries (semiconductors, critical minerals, etc.) represent the global picture, and the misconception that the world was ever close to unfettered globalization—making new barriers to international flows appear to break more dramatically with the past.<sup>14</sup> Motivated reasoning also plays a role, with both supporters and critics of globalization amplifying small shifts to support their agendas. And negativity bias is common, drawing more attention to tariff hikes than to new trade agreements, for example.

Finally, there are several compelling reasons why global flows may continue to show resilience moving forward:<sup>15</sup>

1. *Globalization gains still matter*: Most leaders aim to preserve gains from globalization while mitigating risks and vulnerabilities.
2. *Adaptability drives resilience*: Companies have boosted their capacity to adjust rapidly to new cross-border frictions.
3. *De-risking does not equal deglobalization*: Most business is between friendly countries, and shifts of production to alternative locations often boost trade and international investment.
4. *Technology could still boost global flows*: Technology has historically expanded globalization by reducing the costs and challenges of distance. New technologies such as AI could again boost growth in global flows.
5. *Multipolar growth expands opportunities*: While geopolitical rivalry creates risks, a broader spread of economic activity across countries also multiplies opportunities for international exchange.

The risks to globalization are real, but so is the resilience of international flows. So far, companies and countries are managing the challenges and opportunities of a complex and highly interconnected world rather than retreating behind national borders.

## 2. GLOBALIZATION SNAPSHOT

The latest data on international flows show that global ties have remained strong despite multiple waves of shocks to the international environment. The DHL Global Connectedness Index depth trend shows a stable level of international relative to domestic activity. Geopolitical tensions and conflicts have only reshaped a small share of global flows, even as the world's largest economies—the U.S. and China—do show larger shifts. Meanwhile, international flows are traversing the longest average distances on record, as more flows take place between rather than within geographic regions.

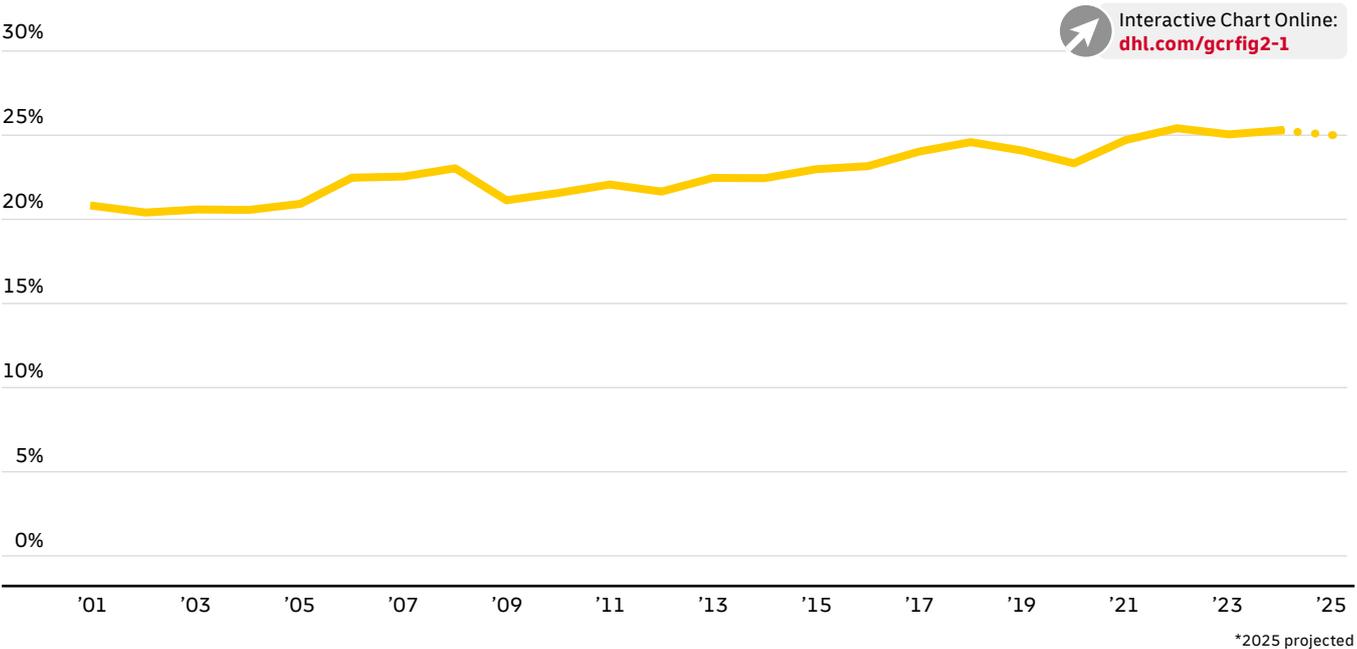

# GLOBAL FLOWS REMAIN STABLE VERSUS DOMESTIC ACTIVITY

President Donald Trump’s return to the White House in January 2025—along with new tariffs and renewed trade policy volatility—has intensified long-standing concerns about the future of globalization (see **The Globalization Debate in 2025** on p. 17). Yet despite this turbulence, actual flows between

countries have remained surprisingly resilient. We begin this section by examining the balance of international relative to domestic activity, before considering changes in the geographic patterns of international flows.

**FIGURE 2.1: DHL GLOBAL CONNECTEDNESS INDEX DEPTH TREND, 2001 – 2025\***

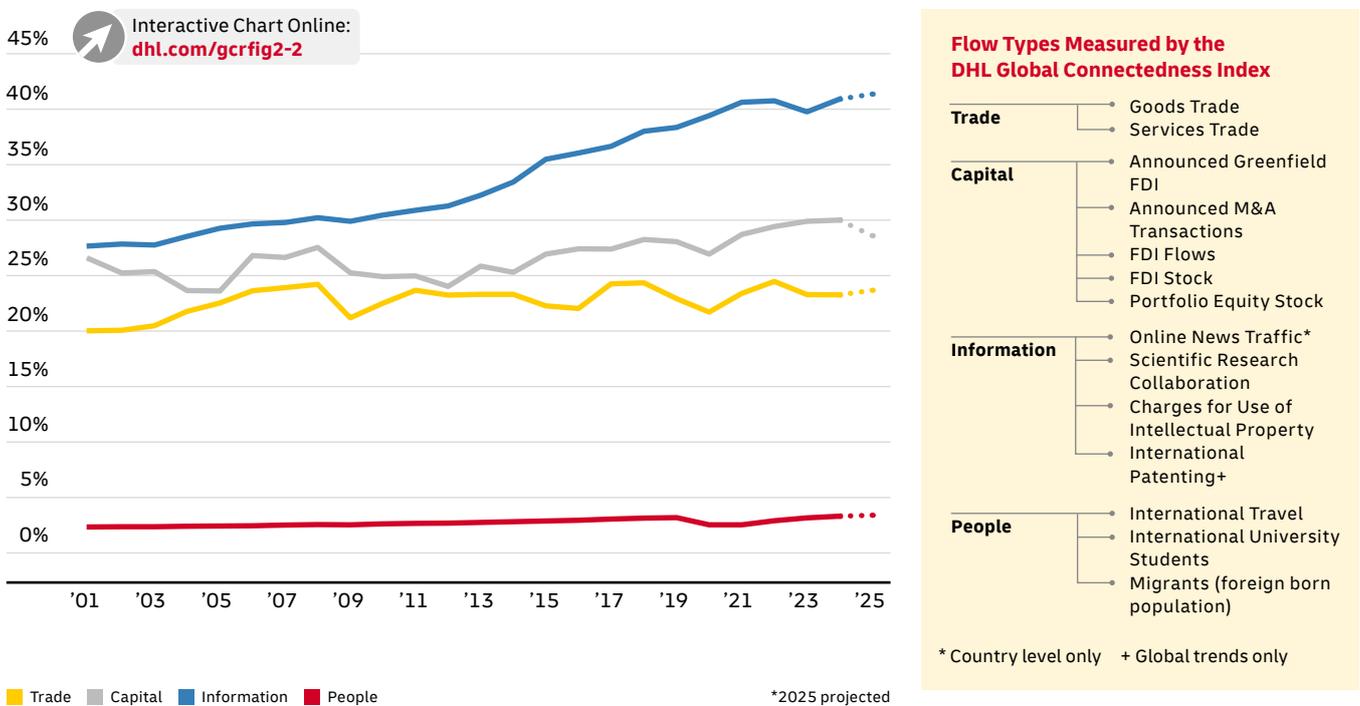

The depth of global connectedness reached a record high level of 25% in 2022, and currently available data indicate that it maintained a similar level in 2025. Note: Scaled from 0% (no flows cross national borders) to 100% (no border or distance effects).

### Globalization remains limited

The depth index tracks the balance between international and domestic activity across 13 types of trade, capital, information, and people flows. Considering our focus on business and economics, trade and capital flows are given more weight (35% each) than information and people flows (15% each). The index rises when international flows grow faster than domestic activity and declines when they lag behind domestic growth. The global results are scaled between 0% (a world of completely separate countries) and 100% (a completely globalized “frictionless” world, where national borders and distance pose no constraints to international flows).<sup>1</sup> **Today’s depth level indicates that the world is only about one-quarter of the way to a theoretical state of complete globalization, and only about 20% more globalized than it was in 2001.**

**FIGURE 2.2: DHL GLOBAL CONNECTEDNESS INDEX PILLAR DEPTH TRENDS, 2001 – 2025\***

**Information flows have reached the highest globalization levels compared to the other three flow types. Capital flows are second, followed by trade flows. People flows lag far behind, at much lower levels of globalization.** Note: Scaled from 0% (no flows cross national borders) to 100% (no border or distance effects).

**Depth trend holding steady around 25%**

The DHL Global Connectedness Index tracks a depth trend<sup>2</sup> that measures international relative to domestic activity (see **Figure 2.1**). After rising from 20.8% in 2001 to a peak of 25.4% in 2022, this measure has not changed meaningfully in recent years. It stood at 25.3% in 2024 and currently available data indicate a similar level (25.0%) in 2025. Despite significant global turbulence, there has been no meaningful retreat from international to domestic activity. (For additional historical context, see **Recent Trends in Historical Perspective** on p. 16.)

**Four pillars show minimal movement in 2024–2025**

**Figure 2.2** breaks the depth trend into its four pillars—trade, capital, information, and people—to measure the globalization of four broad categories of human activity. None show unusual changes in 2024 or 2025. Since 2023, a decline on the capital pillar has been largely offset by small gains across the trade, information, and people pillars.<sup>3</sup>

**Trade:** Goods and services trade has fluctuated around 22–24% of the theoretical “complete globalization” level for more than a decade. As reported on pages 27–33, about 21% of the value of all goods and services produced around the world is traded internationally.<sup>4</sup> Trade growth was surprisingly robust in 2025, leading to a modest increase in global trade intensity.

Goods are traded far more than services: 32% of value added from goods production serves foreign markets, compared with 15% for services. While global goods trade intensity has decreased since the 2008 global financial crisis, it has held steady over this period when excluding China. Services trade intensity, by contrast, continues its long-term rising trend.

Trade Pillar Depth

**Capital:** International investment trends were mixed in 2025, with current data showing a decline in announced greenfield foreign direct investment (FDI), alongside increases in overall FDI flows and resilient cross-border M&A activity. The 2025 estimate for the capital pillar is subject to especially high uncertainty due to the volatility of capital flows and longer reporting lags for FDI and portfolio equity stocks.

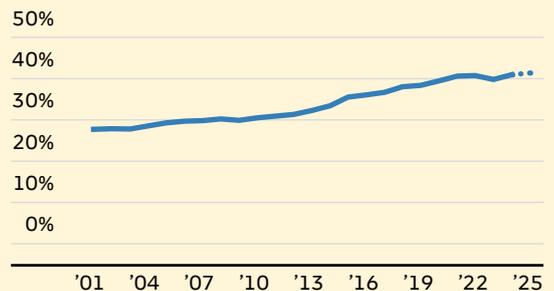

From an international business perspective, current data do not indicate a general pattern of companies shifting investment from foreign to domestic markets. The share of M&A transactions taking place across national borders has not changed appreciably in recent years. Additional detail reported on pages 34–39 shows that multinational firms continue to conduct close to the highest recorded shares of their business abroad.

Capital Pillar Depth

**Information:** Over the past two decades, information flows have seen the strongest globalization gains. Since 2021, however, growth has become slower and more volatile. Data reported on pages 40–41 show that international patenting has decelerated, and cross-border scientific collaboration and royalties for the use of foreign intellectual property have both declined. Geopolitical tensions and policy restrictions on data flows may now be meaningfully constraining the globalization of information.

Information Pillar Depth

**People:** After collapsing during the Covid-19 pandemic, international people flows have recovered fully, propelling this part of the index to new highs in 2024 and 2025. As discussed on pages 42–44, there are long-term rising trends across all types of international people flows measured: tourism, student mobility, and migration.<sup>5</sup> People flows, however, remain far less globalized than trade, capital, or information. Most people seldom travel abroad, and only 3.7% of the world’s population lives outside their birth country.

People Pillar Depth

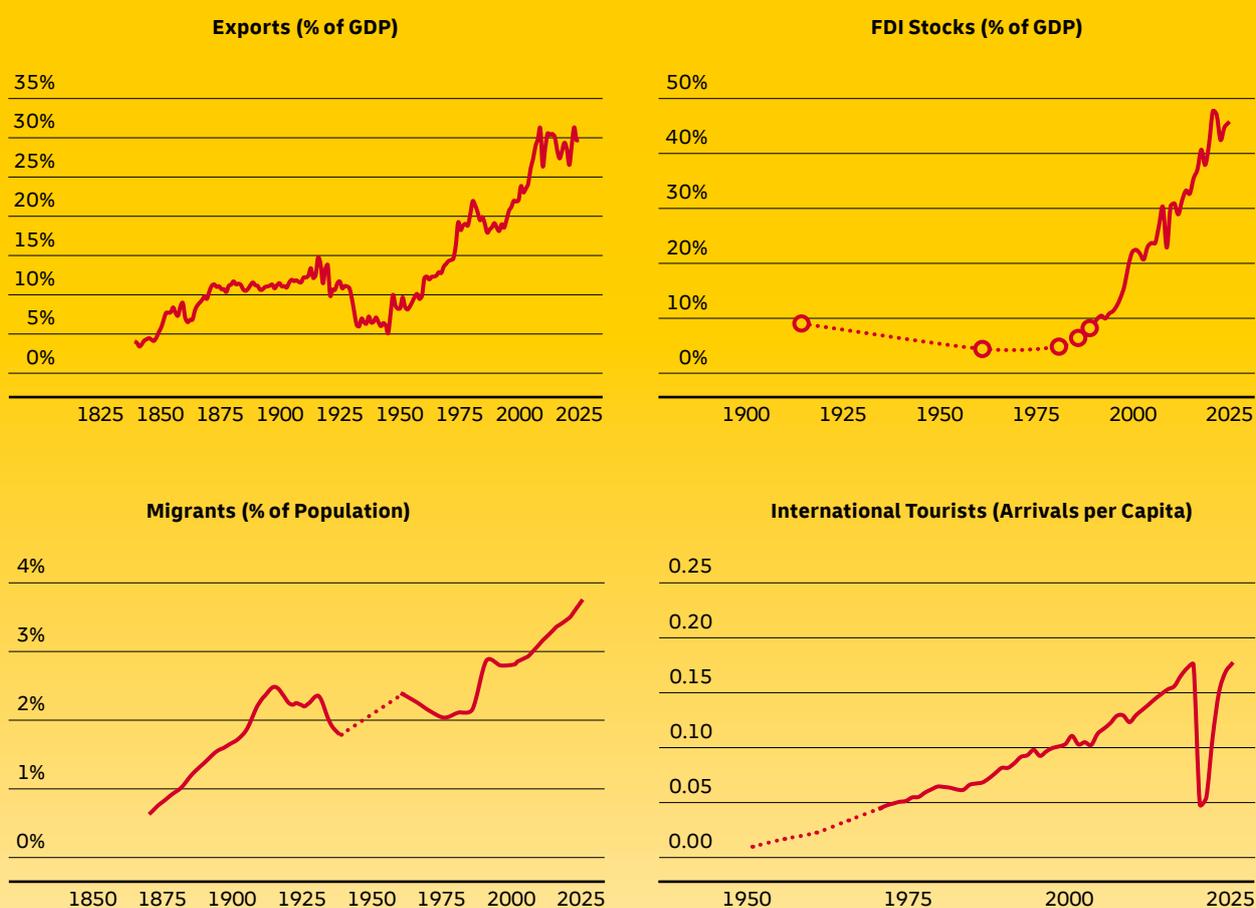

Note: Scaled from 0% (no flows cross national borders) to 100% (no border or distance effects). 2025 values are projected.

## RECENT TRENDS IN HISTORICAL PERSPECTIVE

To provide a balanced view of recent trends in international flows, it is helpful to consider them in relation to long-run patterns. Here, we look back at the growth of international trade, investment, migration, and tourism over time spans ranging from several decades to almost

two centuries. **Figure 2.3** tracks long-run trends, showing how all of these aspects of globalization have soared over the last few decades and remain at or near all-time highs.

**FIGURE 2.3: LONG-RUN TRADE, FDI, MIGRATION, AND TRAVEL TRENDS<sup>6</sup>**

**The world is at or close to a record high level of globalization based on selected measures of international trade, investment, migration, and travel.**

### Broader indicators confirm a stable balance of global vs. domestic activity

**Section 3** provides a much more detailed analysis of international relative to domestic activity, tracking trends across a wide variety of specific types of international trade, capital, information, and people flows. It also supplements those broad macro-level trends with material on the globalization of multinational firms (tracking foreign sales and operations)

and the development of global value chains. While trends vary across indicators, the overall pattern is a fairly stable balance of international relative to domestic activity. Companies and countries are not generally pulling back from international engagement.

## THE GLOBALIZATION DEBATE IN 2025<sup>7</sup>

The dramatic U.S. tariff hikes in 2025 triggered renewed predictions of major shifts in the global business environment. Some observers framed this as a pullback from globalization, though most emphasized transformation rather than reversal. (Section 7 explains why deglobalization narratives persist even as the data in this report show that global flows remain resilient.)

*“At a time when the world should be deepening cooperation and expanding opportunity, we are seeing the opposite. Barriers are rising. Globalization is retreating. And the consequences for sustainable development are profound.”*

—**António Guterres, Secretary-General of the United Nations**

*“Globalization isn’t vanishing; it’s changing. Growth is becoming more balanced, more digital and more distributed.”*

—**Jane Fraser, CEO of Citi**

*“Despite a U.S.-driven trade war with China, voters turning to populism across the globe and the risk of a recession, reports of globalization’s demise are—at least for now—overblown.”*

—**Erik van der Marel, Chief Economist at European Centre for International Political Economy**

*“The globalization era has ended but the world isn’t necessarily deglobalizing. Instead, the US and China are pulling apart and, as they do so, other countries are coming under pressure to pick sides.”*

—**Neil Shearing, Group Chief Economist of Capital Economics**

*“I, like others, reckon we’re seeing some deglobalization—deglobalization from a Global North led global economy... but it is creating opportunities for countries across the Global South to trade more with themselves.”*

—**Robin Niblett, Distinguished Fellow and Former Director of Chatham House**

*“Despite the handwringing about United States President Donald Trump’s tariff war, which many claim sounds the death knell for the world’s trading system, and worries about heightened geopolitical tensions, globalization is not ending. But it is being fundamentally restructured by geopolitical shifts, technological transformation, and climate change.”*

—**Zia Qureshi, Senior Fellow at Brookings and Former Director of Development Economics at World Bank**

*“Globalization is not going away. Comparative advantage will continue to play an important role in shaping trade patterns, and after decades of investment, a substantial decoupling is not practical. But it is no longer sufficient for a trade relationship to be driven solely by lowest-cost production, just-in-time inventory, and seamless, direct supply chains.”*

—**John Waldron, President and Chief Operating Officer of Goldman Sachs**

*“We see some geoeconomic fragmentation, but we don’t see yet any deglobalization. The policy choices that are being made now—this year—are really going to determine which path we are going to go down as a global economy.”*

—**Ralph Ossa, Former Chief Economist of the World Trade Organization**

## 2025 GLOBAL BUSINESS SHIFTS IN RECENT CONTEXT

Even as global flows remain stable relative to domestic activity, patterns of who trades and collaborates with whom continue to evolve. While 2025 brought some highly unusual monthly swings in trade patterns—such as an 833% year-on-year surge in pharmaceutical exports from Ireland to the U.S. in March—such dramatic shifts were generally temporary and limited in scope.<sup>8</sup> Globally, trade patterns changed more in 2025 than they do in a typical year but less than during other recent disruptions. Meanwhile, greenfield FDI shifted by a typical amount, and M&A patterns were more stable than usual.

### Measuring shifts in global flow patterns

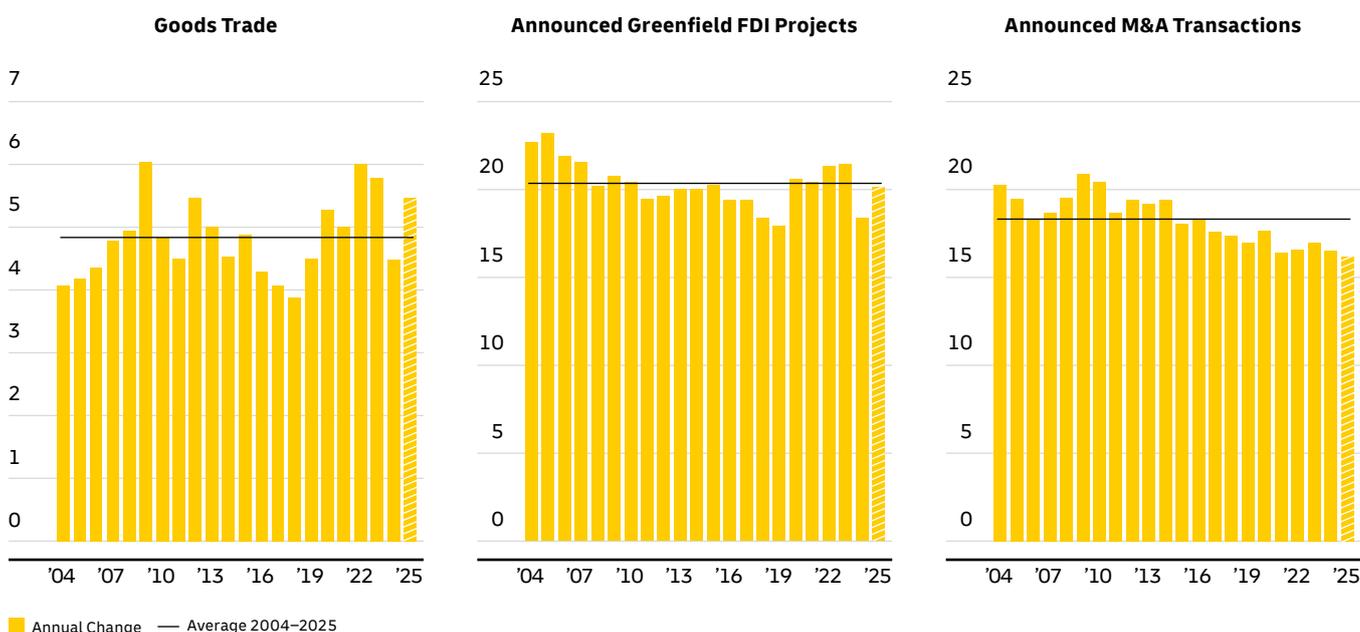

To examine this topic, we measure changes from year to year in the shares of total international flows that take place

between each pair of countries.<sup>9</sup> This measure ranges from 0 (no change at all) to 100 (a complete shift of flows to different partners). **Figure 2.4** shows changes versus the prior year in global patterns of three major types of international business activity for which 2025 data are already available: goods trade, announced greenfield FDI, and announced M&A transactions.

### Goods trade: 2025 shifts larger than usual but not record-breaking

Global goods trade patterns shifted in 2025 somewhat more than they do in a typical year. However, these shifts were smaller than those that occurred during other recent disruptions such as the global financial crisis in 2009 or the early stages of the Ukraine war and post-Covid trade rebound in

**FIGURE 2.4: ANNUAL CHANGE IN INTERNATIONAL BUSINESS PATTERNS**

**Despite new U.S. tariffs and heightened geopolitical instability, trade patterns changed less in 2025 than they did during other recent disruptions, and there were not unusually large changes in patterns of greenfield FDI and M&A activity.**

Data sources: IMF International Trade in Goods, UN Comtrade, Financial Times fDi Markets, SDC Platinum, CPT Single Window, China Customs.

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

2022 and 2023. Changes in U.S. trade patterns in 2025 were more dramatic than those seen globally, as we will discuss later in this section.

**Greenfield FDI: Shifts similar to historical average**

Changes in patterns of announced greenfield FDI in 2025 were similar to historical averages and smaller than those seen in 2022 and 2023. The most dramatic shifts in announced greenfield FDI occurred in the early 2000s, when investment surged into emerging economies, especially China. The more moderate shifts in 2022 and 2023 were driven, in part, by companies diversifying capacity in response to disruptions during the Covid-19 pandemic and early stages of the Ukraine war.

**M&A activity: Continued decline in the pace of change**

Mergers and acquisitions transactions, by contrast, changed much less in 2025 than they have, on average, since 2004. Since peaking in 2009, the pace of change in M&A patterns has been on a long-term declining trend. Like greenfield FDI, international M&A patterns were changing rapidly in the early 21<sup>st</sup> century.

**Limited global realignment despite geopolitical tensions**

The modest shifts in global business patterns in 2025 are consistent with the limited realignment of international business along geographic or geopolitical lines at the global level. We turn next to the fairly stable global geography of international flows, before examining the more dramatic shifts that are apparent in the international activity of countries at the center of today's geopolitical competition.

## GLOBAL TRENDS IN THE GEOGRAPHY OF INTERNATIONAL FLOWS

The geography of international flows can be analyzed in a variety of ways. For a convenient overview of global trends, we use four measures here: geographic distance, geopolitical distance (based on UN voting alignment), diversification across partner countries, and how closely individual country patterns match global patterns.

### Record-breaking long distance flows

The geographic distance trends (Figure 2.5) provide strong evidence against the notion that international flows are becoming more regionalized. Since flows within regions occur over shorter distances than flows between regions, increases in regionalization would be expected to lead to flows averaging shorter distances.<sup>10</sup>

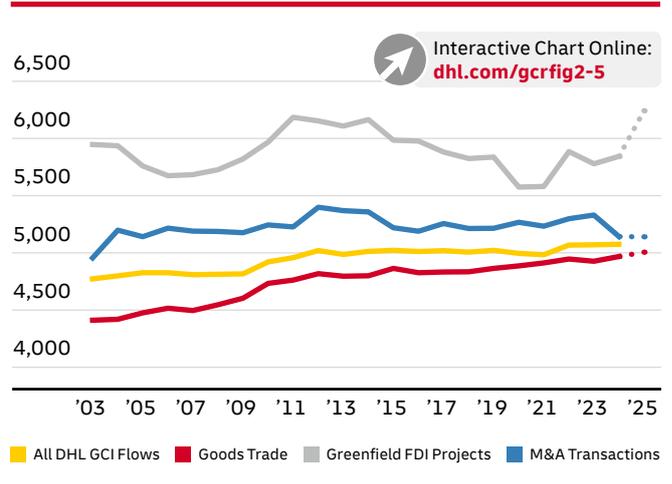

To the contrary, the trade, capital, information, and people flows measured on the DHL Global Connectedness Index (GCI) took place over the longest distance on record in 2024 (the most recent available year on this aggregate measure). Considering flows with 2025 data already available, goods trade and announced greenfield FDI transactions set new records for even longer geographic distances in 2025.

### Mixed evidence of ‘friendshoring’

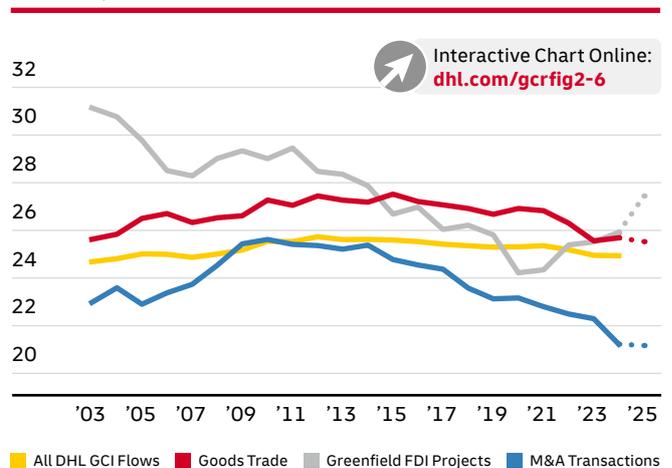

The geopolitical distance trends (see Figure 2.6, measured on a 0–100 scale based on UN voting patterns) show some evidence of weaker ties between countries with opposing geopolitical alignments. This pattern is mainly due to weaker U.S.–China ties and the break between Russia and Western-aligned countries since the full-scale invasion of Ukraine.

The average geopolitical distance across all flows on the DHL GCI has been falling since 2012, with a sharper drop in 2022 and 2023 after Russia’s full-scale invasion of Ukraine. Flows with 2025 data available, however, do not show a general pattern of more business happening between countries with closer geopolitical alignments. The average geopolitical distance for greenfield FDI has been rising since 2021. The average geopolitical distance for goods trade rose slightly in 2024 and then fell back to roughly its 2023 level in 2025. A long-run falling trend in geopolitical distance for M&A did not continue in 2025.

**FIGURE 2.5: AVERAGE GEOGRAPHIC DISTANCE (KM)<sup>11</sup>**

**FIGURE 2.6: AVERAGE GEOPOLITICAL DISTANCE (0 – 100, BASED ON UN VOTING)<sup>12</sup>**

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

### De-risking has not boosted diversification

Diversification trends, shown in **Figure 2.7**, do not demonstrate a clear pattern of countries spreading their international activity across more partner countries. We measure diversification on a 0–1 scale using the complement of the Herfindahl-Hirschman Index (HHI) of concentration.<sup>13</sup>

The aggregate trend for all DHL GCI flows shows a modest decline in diversification since 2019. Among the measures with 2025 data available, greenfield FDI became less diversified since 2024, while diversification in goods trade and M&A remained fairly stable. These results indicate that de-risking strategies have not—at least yet—led to a general increase in the diversification of countries’ international flows across a wider variety of partner countries.

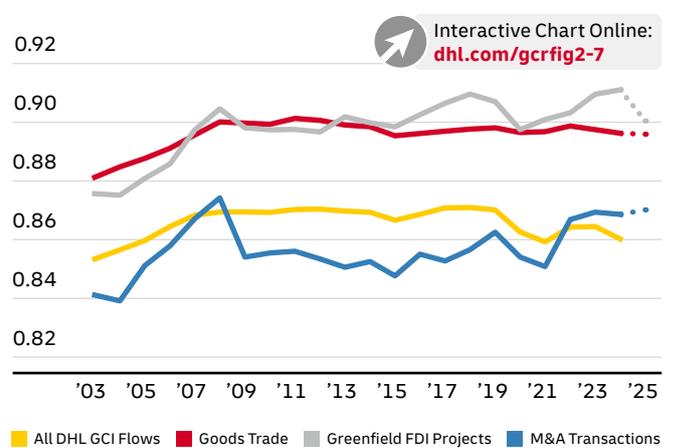

### How closely do flow patterns at the country level match global patterns?

The match of country versus world flow patterns (**Figure 2.8**) is used to measure the breadth of international flows at the country level in the DHL GCI rankings reported in **Section 6**. Globally, if every country’s flows were spread across the same partner countries in exactly the same proportions, this measure would equal 100%, and if there was no match at all between country-level patterns and global patterns, this measure would equal 0%.<sup>14</sup>

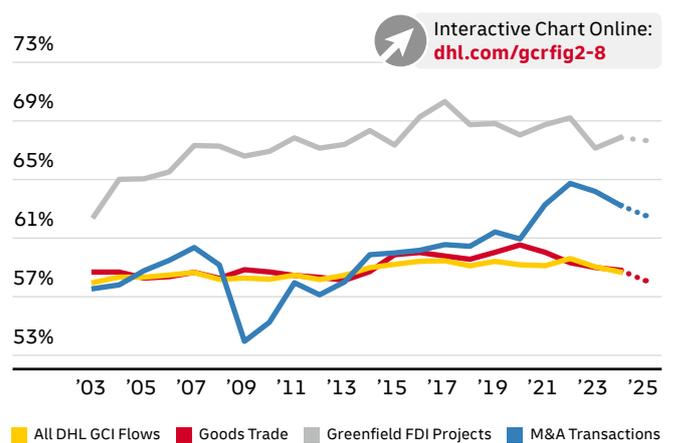

This measure of breadth across all DHL GCI flows peaked in 2022 and has since declined modestly. It has also declined for goods trade, greenfield FDI, and M&A transactions. These results indicate that individual countries’ flow patterns differ slightly more from the global patterns than they did in 2022. This fits with the notion that a company’s home country has an increasing influence on where it does business abroad.<sup>15</sup>

All of the recent shifts in global patterns of international flows reported here are fairly small. There is evidence of international flows following geopolitical alignments somewhat more closely, and the data show individual country flow patterns differing more from overall global patterns. At the same time, the average distance measures contradict the notion that international flows are becoming more regional, and the data do not indicate a general pattern of international flows becoming more diversified across partner countries. We delve deeper into these topics in **Sections 4 and 5**.

**FIGURE 2.7: AVERAGE DIVERSIFICATION (1 – HHI)<sup>16</sup>**

**FIGURE 2.8: AVERAGE MATCH OF COUNTRY VS. GLOBAL PATTERNS (BREADTH, 0 – 100%)<sup>17</sup>**

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

## MAJOR SHIFTS IN THE UNITED STATES, CHINA, AND RUSSIA

Global connectedness remains stable overall, with only modest shifts in the geography of international activity. However, three major players at the center of today's shifting geopolitical landscape—the U.S., China, and Russia—have seen substantial shifts in international flows across partner countries, reduced ties with adversaries, and some declines in participation in particular types of flows.

### **United States: Tariff-driven disruption and rising inward investment**

The U.S. initiated the most dramatic policy shifts in 2025, imposing sharp tariff increases on nearly all trade partners. This resulted in a spike in the rate of change in U.S. trade patterns: U.S. import sources and export destinations both changed more in 2025 than in any other year covered in our analysis (see **Figure 2.9** for selected measures of U.S. imports).

U.S. import sources changed roughly twice as much in 2025 as they do in an average year. As detailed in **Section 4**, direct imports from China fell especially sharply: the share of U.S.

imports coming from China had already declined from 22% in 2017 to 13% in 2024, and then fell to just 9% in 2025 (January–September).

U.S. trade pattern shifts also reflect the effects of tariff increases initiated during the first Trump administration and subsequent de-risking efforts. Since 2018, U.S. imports span shorter geopolitical distances and have become more diversified across source countries. Despite U.S. business and policy interest in nearshoring, however, there is no ongoing trend of U.S. imports traversing shorter geographic distances.

There is also a modest declining trend in the value of U.S. imports as a share of GDP, bringing this depth ratio down to only 11% in 2024. The U.S. goods imports-to-GDP ratio was the lowest among all advanced economies. While this is due primarily to the large size of the U.S. domestic economy, it is striking that only Angola, Argentina, Chad, and Venezuela imported less relative to the sizes of their economies. Current projections show no meaningful change in U.S. imports as a share of GDP in 2025, but tariff increases could bring this ratio even lower moving forward.

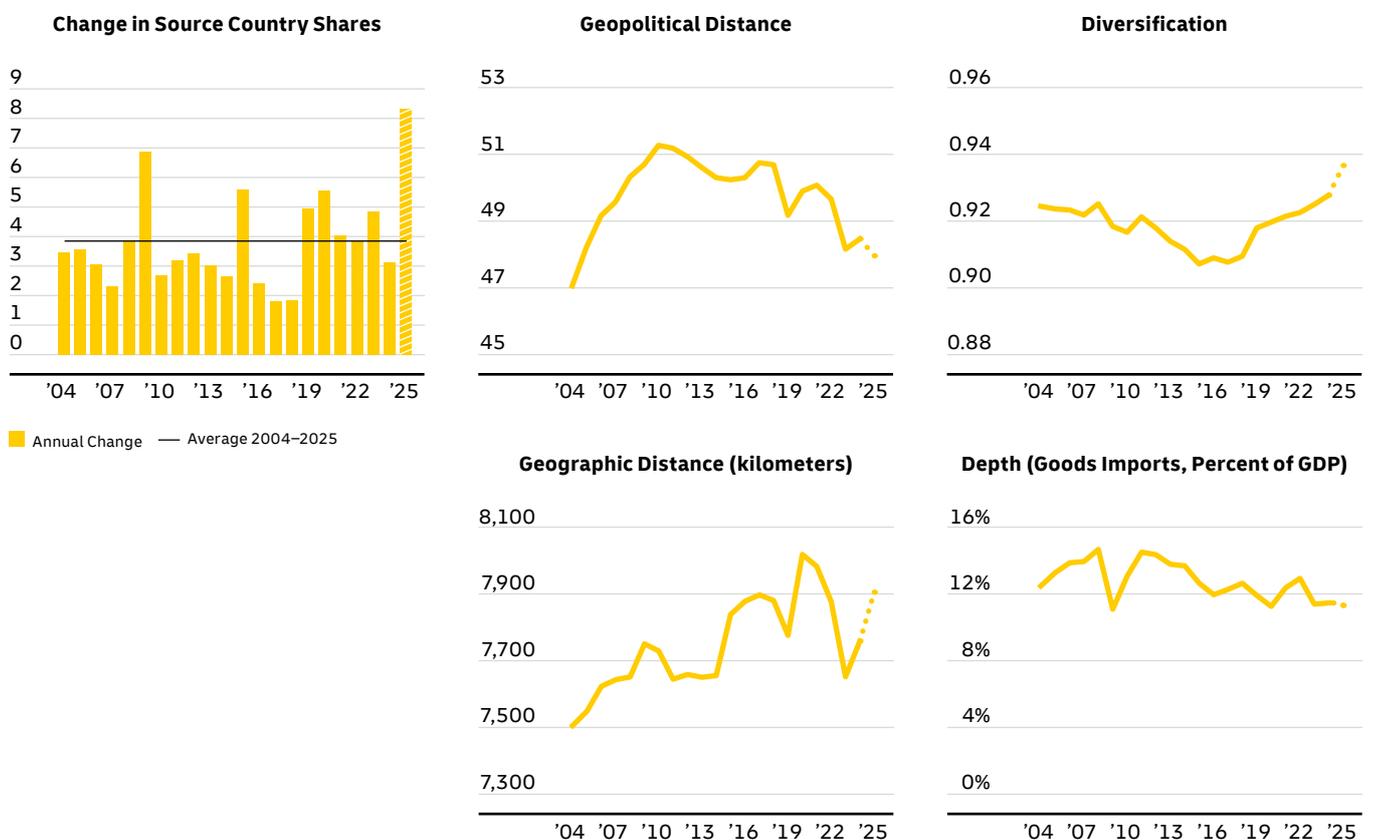

Looking beyond trade in goods, the most notable recent shift in U.S. international flows is an increase in inward announced greenfield investment. Estimated capital expenditure on inward greenfield FDI as a share of U.S. GDP began rising in 2021 and has continued increasing through 2025. Even as the U.S. raises trade barriers, it is actively courting inward investment, embedding investment pledges in recent trade deals and easing regulatory approvals.

### **China: Expanding the global footprint while reducing inward exposure**

China shows a pattern of increasing presence abroad via larger exports and outward investment, juxtaposed against reduced reliance on imports and inward investment.

**Figure 2.10** highlights trends for China's goods trade and announced greenfield FDI. Since the Covid-19 pandemic,

**FIGURE 2.9. RECENT SHIFTS IN UNITED STATES GOODS IMPORTS**

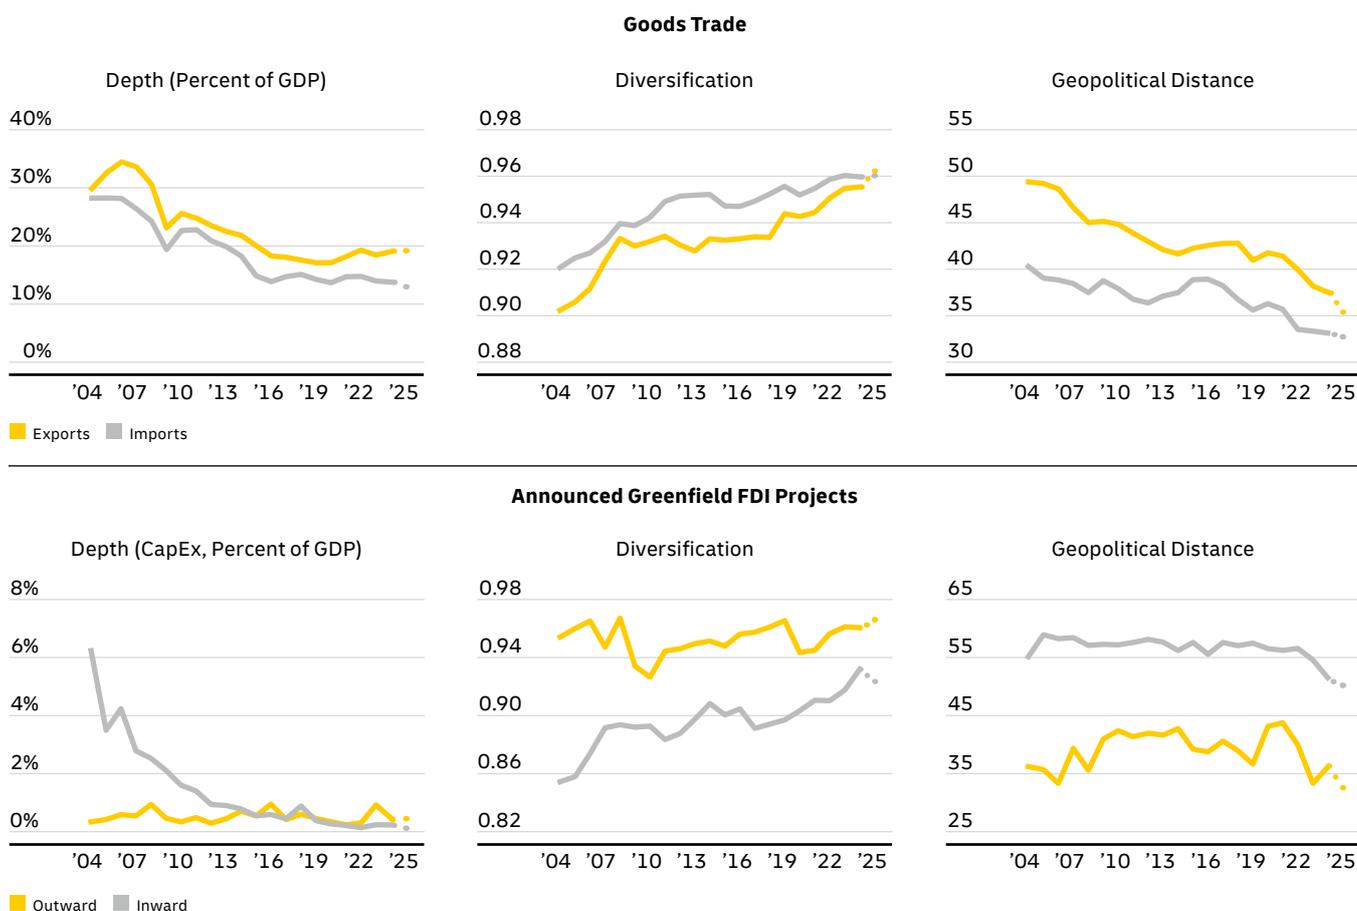

**U.S. imports shifted more across sources in 2025 than in any prior year covered in our analysis. Since 2018, U.S. import sources have become more diversified, and they have also traversed shorter geopolitical—but not geographic—distances.**

Data sources: IMF International Trade in Goods, IMF World Economic Outlook, World Bank World Development Indicators, CEPII Gravity  
 Note: Geopolitical distance calculated according to 2019–23 UN General Assembly votes (rescaled 0–100), based on the Ideal Point Distance measure reported by Bailey, Strezhnev, and Voeten (2017). Goods trade data for 2025 cover January to September only.

China’s goods exports-to-GDP ratio has been rising while its imports-to-GDP ratio has been declining. Similarly, inward announced greenfield FDI continues to fall as a percentage of China’s GDP, while outward greenfield FDI increases. Since 2021, Chinese companies have announced larger investments abroad than foreign companies have announced in China.

There are also substantial rising trends in the diversification of China’s goods trade and greenfield FDI across partner countries. The largest increase in diversification has been for goods exports, which has supported the resilience of China’s exports in the face of U.S. tariff increases. The share of China’s exports going to its top 5 destination countries fell from 45% in 2018 to only 35% by 2025.

**FIGURE 2.10. RECENT SHIFTS IN CHINA GOODS TRADE AND GREENFIELD FDI**

**China's trade and investment data indicate a pattern of rising presence abroad via increased exports and outward investment, juxtaposed against declining reliance on imports and inward investment.**

Data sources: UN Comtrade, China Customs, Financial Times FDI Markets, IMF World Economic Outlook, World Bank World Development Indicators  
 Note: Geopolitical distance calculated according to 2019–23 UN General Assembly votes (rescaled 0–100), based on the Ideal Point Distance measure reported by Bailey, Strezhnev, and Voeten (2017). Goods trade data for 2025 cover January to September only; 2025 announced greenfield FDI data cover January to November only.

China's trade and greenfield FDI have both shifted toward more geopolitically aligned countries. The geopolitical distance over which China trades has been declining since the first U.S.–China trade war heated up in 2018. For greenfield FDI, the shift to shorter geopolitical distances began in earnest only after 2022, when the Ukraine war prompted greater business focus on geopolitical risk.

### Russia: Sharp contraction and reorientation

Russia's international flows have changed even more than the U.S.'s or China's. After the full-scale invasion of Ukraine in early 2022 and sanctions imposed in response, there were dramatic shifts across all aspects of Russia's international activity. **Figure 2.11** highlights selected indicators for Russia's goods exports.

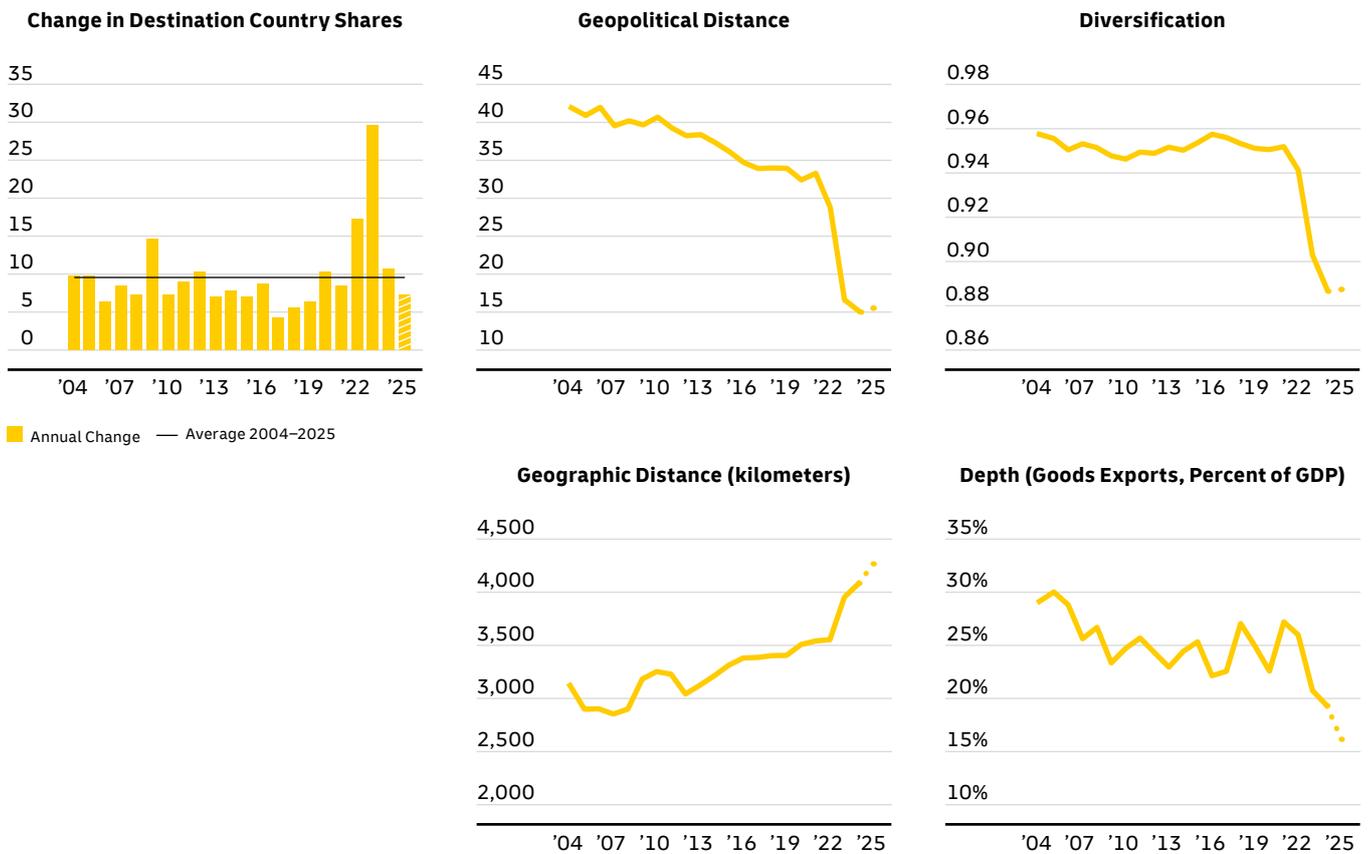

In 2023, Russia's goods exports shifted across destination countries at more than three times the typical annual rate, even after the unusually large changes already seen in 2022. With Russia largely cut off from Western markets, Russia's

exports now traverse shorter geopolitical distances, but they travel over longer geographic distances.

Russia's exports have also become far less diversified across destination countries. The share of Russia's exports going to its top five destinations soared from 39% in 2021 to 62% over the first 9 months of 2025. Last year, three markets alone (China, India, and Türkiye) purchased more than half (52%) of Russia's goods exports.

The value of Russia's goods exports has also declined as a share of the country's GDP. In 2021, Russia's goods exports-to-GDP ratio stood at 27%. By 2024, it was down to only 19%, and current projections call for a further drop to only 16% in 2025.

The patterns observed in Russia's goods exports are mirrored in many other aspects of Russia's international activity. There was an even larger decline in the diversification of Russia's imports than there was for its exports. Inward

**FIGURE 2.11. RECENT SHIFTS IN RUSSIAN FEDERATION GOODS EXPORTS**

**There have been dramatic shifts and declines in Russia's exports since the full-scale invasion of Ukraine in 2022. Russia's exports have become much less diversified across destinations. They cross shorter geopolitical distances and longer geographic distances.**

Data sources: CEPII Gravity, IMF International Trade in Goods, IMF World Economic Outlook, World Bank World Development Indicators

Note: Geopolitical distance calculated according to 2019–23 UN General Assembly votes (rescaled 0–100), based on the Ideal Point Distance measure reported by Bailey, Strezhnev and Voeten. Goods trade data for 2025 cover January to September only.

greenfield FDI into Russia has collapsed, and Russia is also less active in international scientific research collaboration. Across flow types, there is a consistent pattern of Russia's international flows traversing shorter geopolitical distances and longer geographic distances.

### Major powers shift, but represent a fraction of global flows

While the dramatic shifts in the international ties of major geopolitical powers naturally draw attention, they should not be mistaken as indicative of global trends. Far more international activity occurs outside the U.S., China, and Russia than with those countries. While these three economies accounted for nearly half (45%) of global GDP at market exchange rates in 2024, their shares of most types of international flows were much lower, for example, 25% of goods exports, 24% of estimated capital expenditure on greenfield FDI and 22% of outward greenfield FDI projects.

The stark differences in globalization trends among the U.S., China, and Russia—and between these countries and the

rest of the world—highlight the importance of analyzing globalization at the country level in addition to understanding global trends. **Section 6** provides this view, ranking 180 countries by their global connectedness, and the country profiles at the back of this report provide additional detail on each country's international activity.

**In summary**, international flows have remained highly resilient despite recent policy shocks. There has been no meaningful shift from international to domestic activity, and changes to geographic patterns of international flows in 2025 were fairly modest at the global level. By contrast, the U.S., China, and Russia—countries deeply involved in today's global geopolitical competition—do show clear signs of restructuring and, in some areas, reducing their international engagement.

# 3. ARE GLOBAL FLOWS STILL GROWING?

This section examines the growth of international flows relative to domestic activity, tracking a wide variety of trade, capital, information and people flows. In most areas, the growth of international flows is keeping pace with the growth of domestic activity.

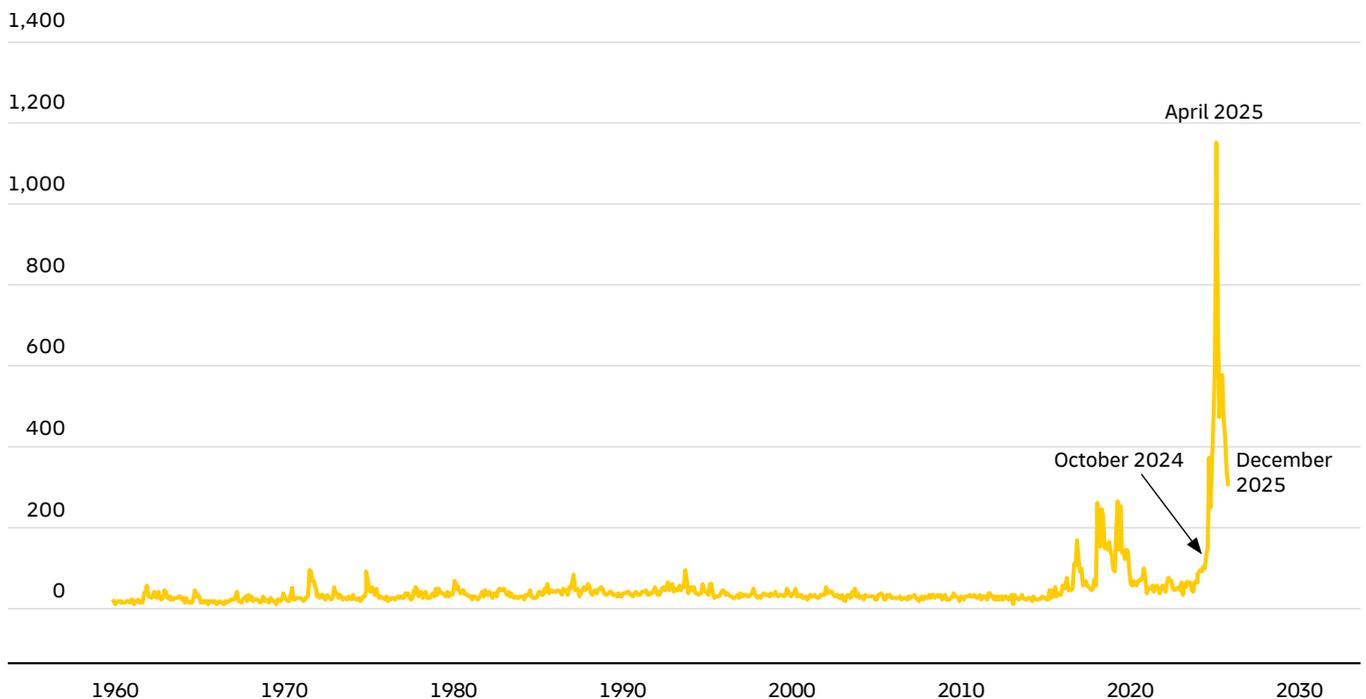

## TRADE FLOWS

International trade is the aspect of globalization that has faced the most dramatic policy shifts since Donald Trump's re-election as U.S. president in November 2024. Uncertainty about future trade policies soared immediately after the election (see **Figure 3.1**) and peaked in April 2025, when President Trump announced even higher than anticipated "Liberation Day" tariffs affecting nearly all U.S. trade partners.

### 2025 trade growth surprisingly robust

Actual trade growth in 2025, nonetheless, was surprisingly robust. Rather than contracting as some predicted, global trade volume growth accelerated in early 2025 (see **Figure 3.2**).<sup>1</sup> Goods trade volumes grew faster in 2025 than in any year since 2017, except during the 2021 rebound after trade plummeted at the beginning of the Covid-19 pandemic.<sup>2</sup>

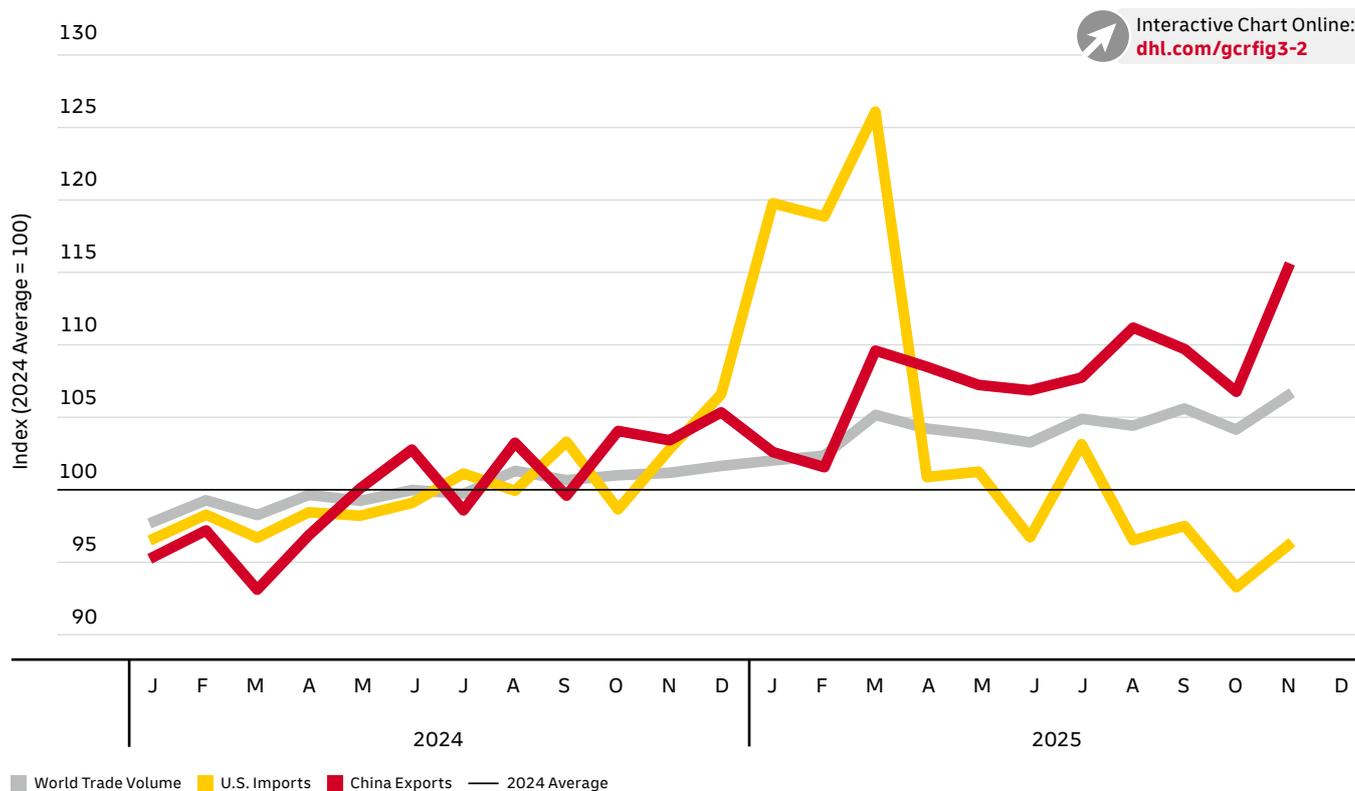

**FIGURE 3.1: TRADE POLICY UNCERTAINTY, 1960 – 2025**

Uncertainty about future trade policies soared to the highest level on record after the re-election of U.S. President Trump in November 2024 and peaked following President Trump's "Liberation Day" tariff announcement in April 2025. Data source: Caldara et al. (2020).

Trade Policy Uncertainty is measured based on the share of news articles discussing trade policy uncertainty in the Boston Globe, Chicago Tribune, Guardian, Los Angeles Times, New York Times, Wall Street Journal, and Washington Post. A value of 100 means that one percent of news articles discuss trade policy uncertainty.

**FIGURE 3.2: MONTHLY GOODS TRADE VOLUME VERSUS 2024 BASELINE**

**A surge of imports into the U.S. drove an acceleration of global trade growth in early 2025, and the growth of China's exports to other (non-U.S.) markets helped to sustain global trade volumes even after U.S. imports fell below the prior year levels.** Data source: CPB World Trade Monitor

#### Trade Growth Measures: Volume vs. Value

Figure 3.2 shows trade growth in *volume* terms, which simply means that we hold price levels constant to show actual changes in the amount of goods traded (trade volume does not refer to the size or weight of the goods traded). Elsewhere, we use data on trade in *value* terms, i.e., in current prices, but we prefer to use trade volume growth statistics because fluctuations in the prices of traded goods (especially commodities) can cause large swings in trade value even when no significant changes have occurred in the amount of goods traded.

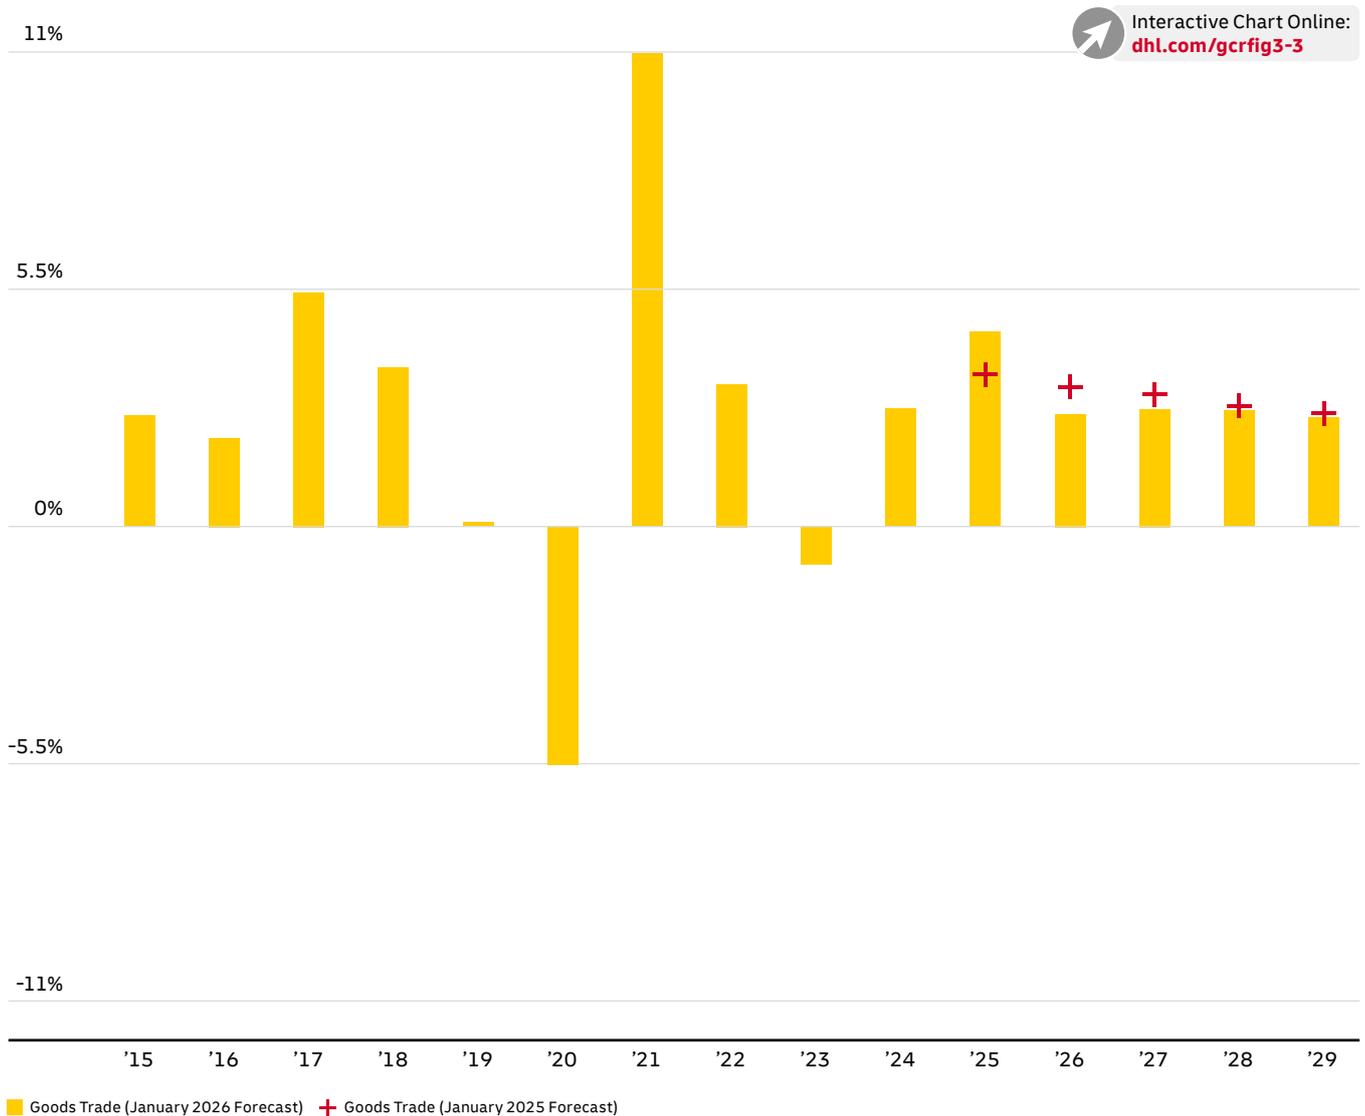

#### U.S. front-loading drove early 2025 trade surge, then reversed

One factor supporting trade growth in early 2025 was U.S. importers rushing goods into the country in anticipation of tariff increases. This front-loading wave peaked in March, when U.S. imports were 26% above the 2024 average level. Starting in mid-2025, however, U.S. imports fell below 2024 levels in most months, while global trade remained 4–6% higher. In November 2025, U.S. imports were down 4% from the prior year average level, while global trade was up 6%.

#### China offset U.S. decline with more exports to other markets

China's exports helped to support global trade growth after the U.S. front-loading wave went into reverse. From March

through November 2025, China's export volumes ran 7–15% above 2024 levels. This was the result of a major redirection of China's exports away from the U.S. and to alternative markets. Over the full year of 2025, the value of China's exports to the U.S. fell 20%. The drop in the value of China's exports to the U.S. (USD 105 billion) was offset in part by a 13% (USD 79 billion) increase in China's exports to the ASEAN (Association of Southeast Asian Nations) region.<sup>3</sup> Coupled with gains in India, Japan, and Taiwan, China more than offset its reduced exports to the U.S. with larger exports to Asian markets. China also expanded exports to Africa by 46 billion U.S. dollars (+26%) and to the EU by 43 billion dollars (+8%). By the end of 2025, China's trade surplus reached a record 1.2 trillion U.S. dollars.<sup>4</sup>

**FIGURE 3.3: ANNUAL GOODS TRADE VOLUME GROWTH, 2015 – 2029 (FORECAST)**

**Global trade growth beat forecasts in 2025, and even after downgrades to 2026 and 2027 forecasts due to tariff increases, frontloading, and uncertainty about future trade policies, global goods trade volumes are still predicted to grow as fast over the 2026–29 period as they did over the preceding decade.** Data sources: Economist Intelligence Unit; IMF World Economic Outlook Database; Oxford Economics Global Data; S&P Global Market Intelligence

### AI infrastructure investment a major engine of trade growth

Product-level trade data indicate that booming investment in AI infrastructure was a major driver of trade growth in 2025. According to WTO research, AI-related goods accounted for 42% of global goods trade growth during the first three quarters of 2025. AI investment boosted trade across the entire value chain—from raw silicon and semiconductors to servers and telecommunications equipment.<sup>5</sup>

### Medium-term outlook: trade growth to maintain pace from past decade despite downgrades

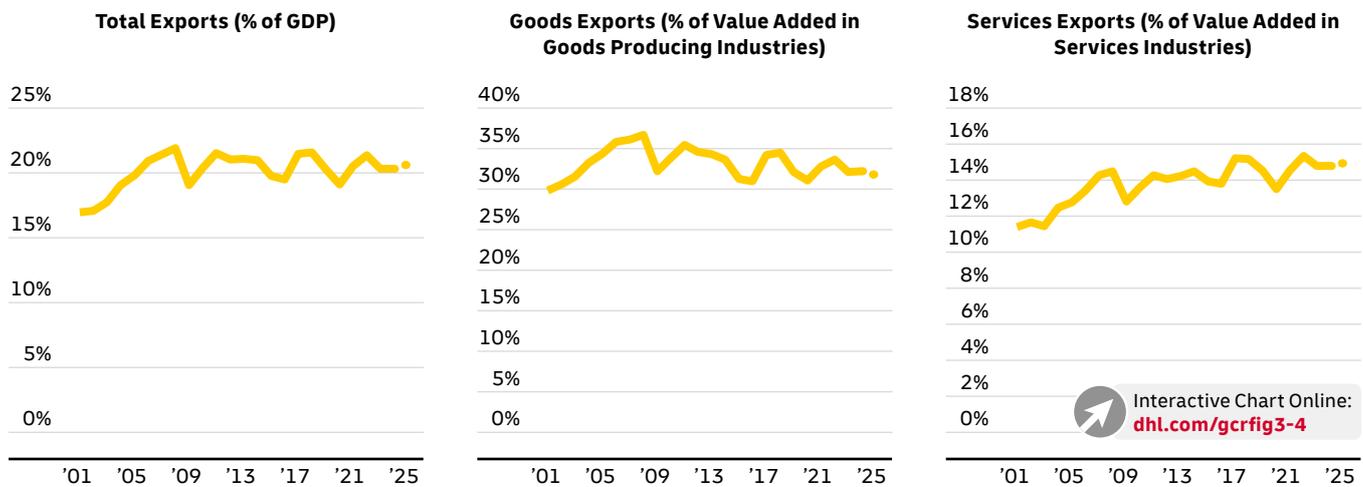

Trade growth forecasts still anticipate that U.S. tariff increases will reduce global trade growth in 2026 and 2027, but the impact is smaller than many assume. **Figure 3.3** compares pre-tariff forecasts from January 2025 with the latest projections as of January 2026, using the composite

forecasts we assemble from four sources for the DHL Trade Atlas publication series.<sup>6</sup>

The January 2025 forecast projected global trade to grow at a 3.0% compound annual growth rate from 2026–29, outpacing the prior decade's 2.6% rate. Even after downgrades tied to tariffs and policy uncertainty, the January 2026 outlook still points to a 2.6% growth rate over the 2026–29 period. This implies that medium-term trade expansion will remain broadly in line with what business leaders have experienced in recent years.

### U.S. trade share limits global tariff impact

One reason global trade can continue growing even as the U.S. raises tariffs to their highest levels since the 1930s is that the U.S. plays a smaller role in global trade than it does

**FIGURE 3.4: WORLD TRADE INTENSITY TRENDS (VALUE ADDED), 2001 – 2025**

The share of global economic output serving foreign markets remains close to a record high level. Services trade intensity is on a rising trend, while goods trade intensity is down from its peak level. Data source: Asian Development Bank Multiregional Input-Output Database

#### GROSS VERSUS VALUE ADDED TRADE INTENSITY

The trade intensity trends shown in Figure 3.4 are reported in “value added” terms, to avoid counting the same value multiple times as it moves through a multi-country production chain. Most trade statistics are reported in “gross” terms, which means the same component can be counted multiple times (each time it crosses a border). For example, the value of a camera sensor exported from Japan to China and then embedded in a phone exported to the U.S. is counted twice, overstating the actual amount of the value of the phone that was traded internationally. Value added measures correct for this, providing a more accurate picture of how much of the world’s economic output is ultimately consumed outside the country where it was produced.

in many other aspects of the global economy.<sup>7</sup> In 2024, the U.S. brought in just 13% of global imports and only 9% of exports originated there. By contrast, the U.S. accounted for 22% of global outward foreign direct investment (FDI) stocks, 26% of GDP at market exchange rates, and 54% of stock market capitalization.<sup>8</sup>

#### Global response to U.S. tariffs supports continued trade expansion

Another factor supporting the global trade outlook is the global response to U.S. tariff hikes. Aside from China, few countries imposed retaliatory tariffs and there was no broader move to follow the U.S. toward higher general levels of trade barriers. Instead, many governments accelerated trade agreement negotiations to secure better access to alternative markets. The EU and Mercosur advanced their long-delayed free trade pact for potential ratification, while the EU concluded negotiations on a new trade deal with Indonesia and updated its agreement with Mexico.<sup>9</sup> India signed trade agreements with the EU, UK, EFTA, New Zealand, and

Oman.<sup>10</sup> China, meanwhile, announced plans to eliminate all tariffs on its imports from Africa and strengthened its trade ties with Southeast Asia.<sup>11</sup>

Momentum is also building toward closer ties between the EU and the 12-nation Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP).<sup>12</sup> While a formal EU-CPTPP trade agreement is not imminent, closer ties between the two blocs could become increasingly significant amid heightened U.S.–China tensions. In 2024, roughly 80% of global trade that involved neither the U.S. nor China included one or both of these blocs.

#### Trade’s share of global economic activity near record high

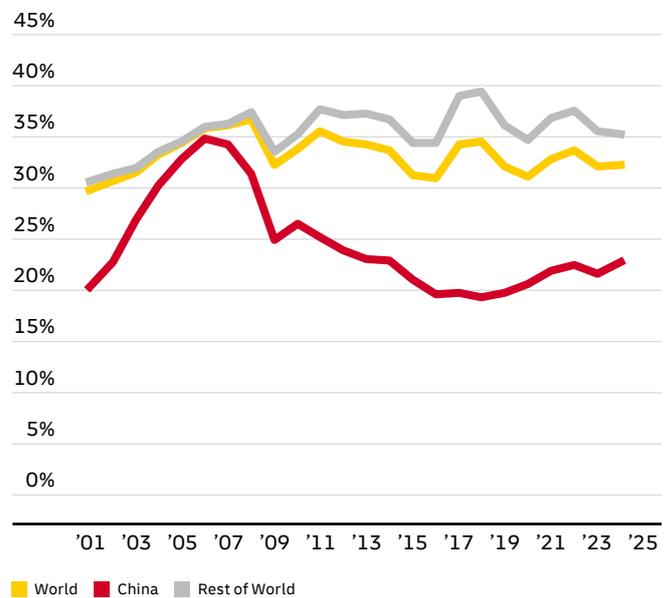

In 2025, an estimated 21% of the value of all goods and services produced worldwide crossed at least one border and ultimately ended up in a different country from where it was produced. This is slightly below the 22% peak level reached in 2008 (see **Figure 3.4**)

Despite turbulence in the trade environment, Figure 3.4 shows that trade’s role in the global economy has not declined appreciably. International production via global value chains has also remained robust (see box titled **The Resilience of Global Value Chains** on p. 33). At the same time, the data underscore that the vast majority of economic activity is still domestic: roughly 80% of global economic output is used in the same country where it is produced.

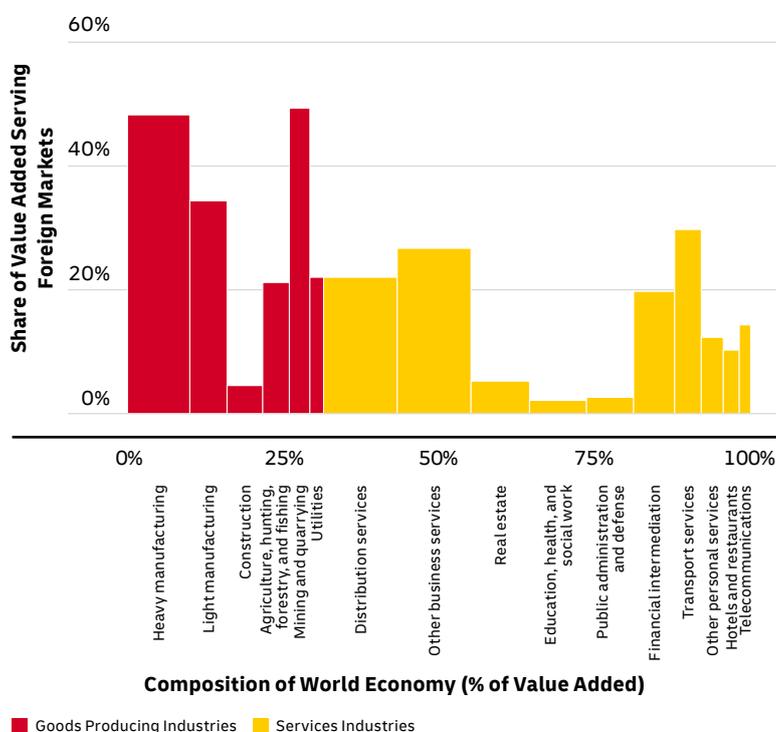

Figure 3.4 also highlights different patterns for goods versus services. Services are traded less intensively than goods, but there is a long-term rising trend for the share of services that are traded internationally (up to an estimated 15% in 2025).<sup>15</sup> The fastest growing part of global trade since the Covid-19 pandemic has been trade in digitally delivered services, which range from offshore business services to streaming and generative AI applications. The post-pandemic recovery of international tourism has also boosted services trade, since spending by travelers in foreign countries is counted as a component of services trade.

The production of physical goods remains more globalized than services, but the share of goods traded has declined meaningfully—from a peak of 37% in 2008 to an estimated 32% in 2025. This drop is largely explained by China’s domestic economy growing faster than its exports between 2006 and 2018 (see **Figure 3.5**). For the rest of the world, the share of goods traded internationally does not show a substantial declining trend. Since 2018, China has again become more export-oriented, helping sustain the resilience of global goods trade after the Covid-19 pandemic.

**FIGURE 3.5: CHINA VERSUS REST OF WORLD GOODS EXPORT INTENSITY, 2001 – 2024**

The recent decline in global goods export intensity was driven by a decline in China’s goods export intensity between 2006 and 2018. For the rest of the world, goods export intensity has not declined meaningfully. After 2018, China’s goods export intensity began rising again.  
Data source: Asian Development Bank Multiregional Input-Output Database

**FIGURE 3.6: EXPORT INTENSITY (VALUE ADDED) BY INDUSTRY, 2024**

This graph provides a snapshot of the entire world economy, highlighting how the intensity of international trade varies across sectors. The width of the bars represents the size of each sector according to its share of the total value produced around the world. The sectors are ordered from largest to smallest. The height of the bars represents the share of their output that is traded internationally, measured according to the share of the value produced in each sector that ultimately ends up in a different country from where it was produced.

**Trade intensity varies widely across industries, with goods-producing industries generally exporting a higher share of their output than industries in the services sector.**

Data source: Asian Development Bank Multiregional Input-Output Database

Note: Calculated using value added content of exports by origin sector (OS) in ADB MRIO Exports Decomposition.

### Trade intensity varies widely across industries

**Figure 3.6** provides a snapshot of the entire world economy, showing industries in proportion to their shares of total value added (on the horizontal axis) and the share of their value added serving foreign markets (on the vertical axis). Goods-producing industries appear on the left, services on the right. In 2024, services comprised about two-thirds of the world economy and goods production one-third.

The industry with the highest export intensity in 2024 was mining, with about 49% of value added from mining ending up in a different country from where it was produced. Heavy manufacturing follows close behind, with 48% of value

serving foreign markets. The sector with the third highest export intensity is light manufacturing (34%), followed by transport services (30%) and other business services (27%). At the opposite extreme, education/health and public administration/defense are both almost entirely domestic, with only 2–3% of value serving foreign markets.<sup>14</sup>

## THE RESILIENCE OF GLOBAL VALUE CHAINS

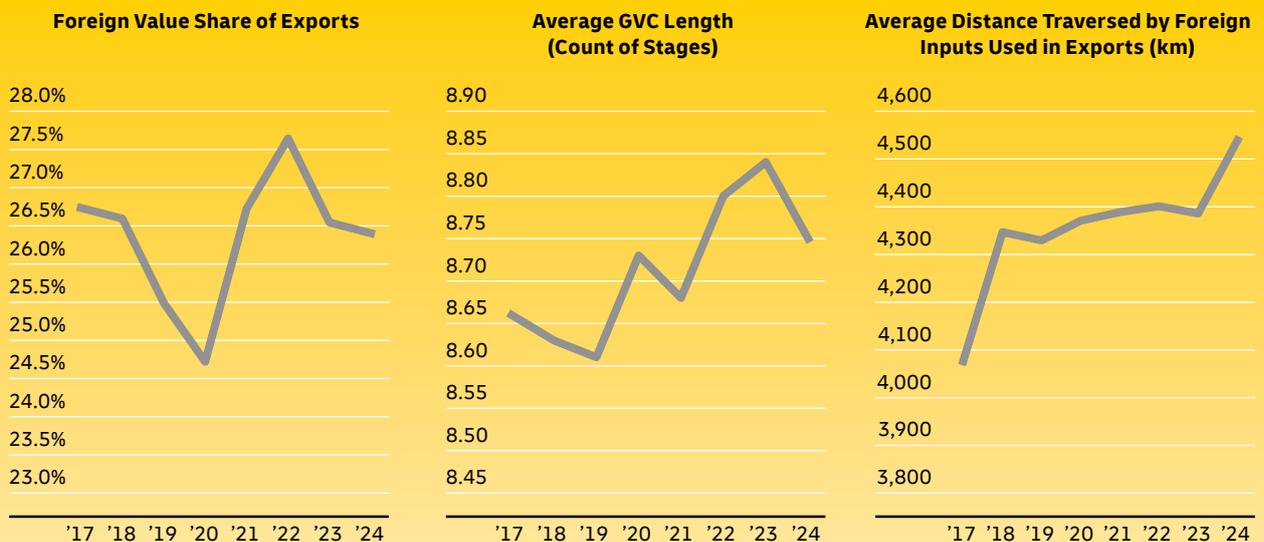

In global value chains, the production of goods and services is split up into stages, with different steps performed in different countries.<sup>15</sup> Such international production is a hallmark of globalization, often involving flows of capital, information, and people along with trade in both intermediate and final goods and services.

Currently, there is substantial interest in restructuring global value chains to increase resilience, with many experts predicting changes such as more domestic production (less reliance on imported inputs), shortening or simplification (crossing fewer national borders), or increased regionalization (concentrating production within geographic regions). The latest

global data, however, shows very limited evidence of such shifts (see **Figure 3.7**). In 2024, 26% of the value of global exports came from imported inputs, down from a record high of 28% in 2022. The average number of stages in global value chains in 2024 was 8.75, very modestly lower than the peak of 8.84 recorded in 2023.<sup>16</sup>

There is also no general pattern of global value chains becoming more regionalized. To the contrary, foreign inputs used in the production of exports traveled the longest distance on record in 2024, consistent with the pattern of trade generally becoming less regionalized, as discussed in **Section 5**.<sup>17</sup>

**FIGURE 3.7: GLOBAL VALUE CHAIN INDICATORS**

Measures of international production via global value chains remain close to peak levels.

Data sources: Global Value Chain Development Report 2025 (Table 1), ADB MRIO Exports Decomposition, CEPII Gravity.

## CAPITAL FLOWS

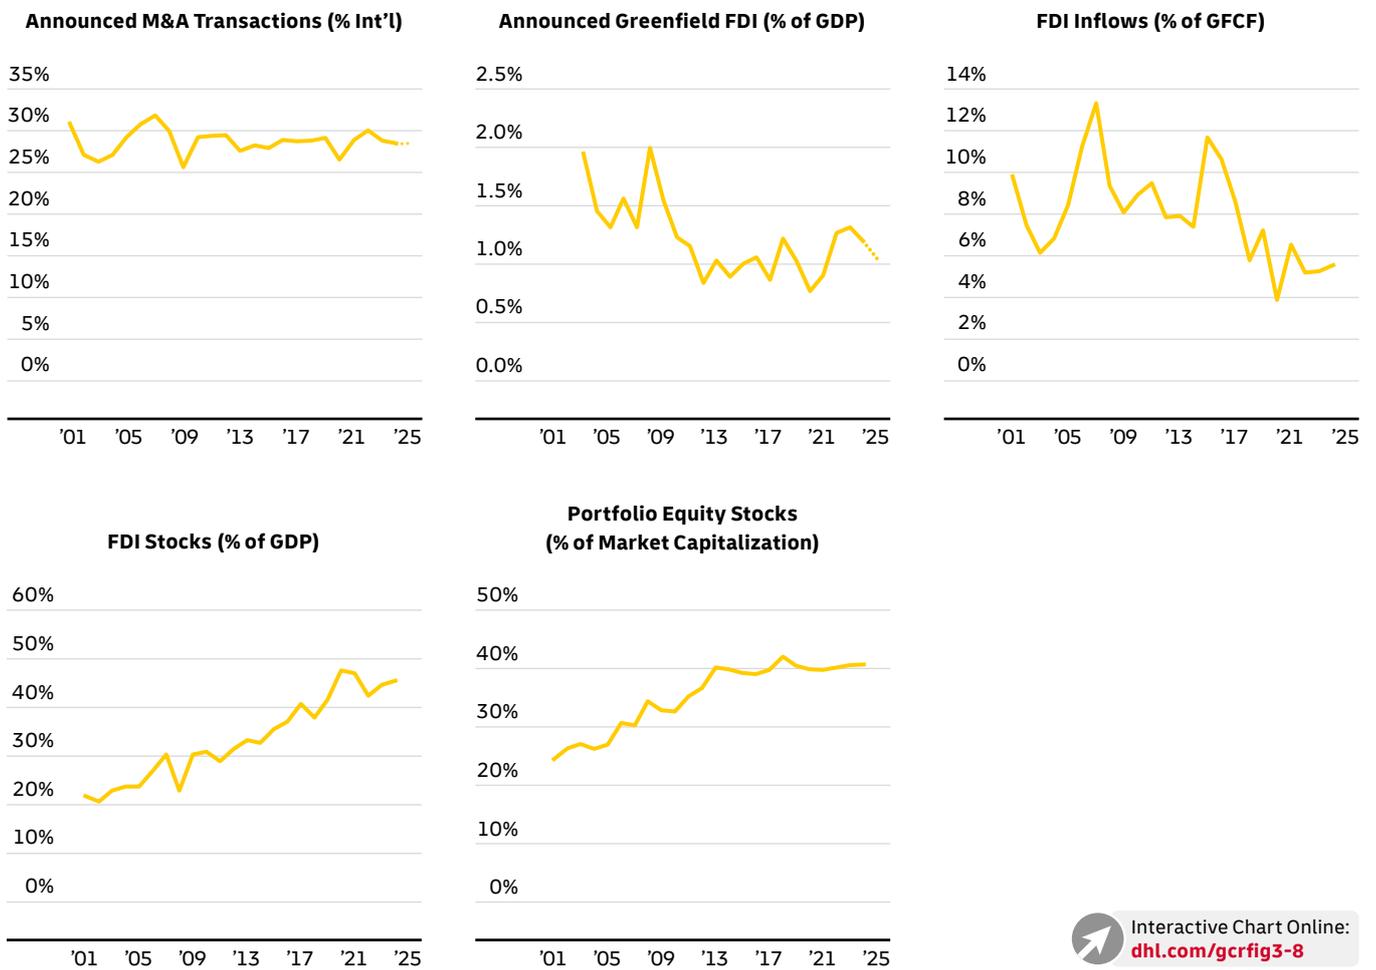

International investment data reinforce the conclusion from the trade data that global business activity remains highly resilient despite a tougher policy environment. While international business investment showed weakness in mid-2025 due to elevated uncertainty, full-year results were surprisingly robust. FDI flows rose an estimated 14% (5% excluding conduit flows).<sup>18</sup> Global M&A (including domestic and cross-border deals) surged an estimated 31%, driven by growth of large transactions. The number of M&A deals increased only 2%.<sup>19</sup>

### Companies maintain steady pursuit of foreign investment opportunities

**Figure 3.8** measures international relative to domestic investment (depth) using five indicators. The indicator that most directly captures the share of foreign relative to domestic business investment is the percentage of *mergers and acquisitions (M&A) transactions* involving companies located in different countries. The cross-border share of announced M&A transactions has fluctuated slightly below 30% for more than a decade and remained within its typical range in 2025. This indicator was unchanged from 2024 to 2025.<sup>20</sup>

Data on *greenfield foreign direct investment (FDI) projects* (which reflect companies setting up new or expanded operations in foreign countries) are more volatile, but have recently shown a similar pattern. The estimated value of announced greenfield FDI relative to world GDP declined in 2024 and was projected to fall again in 2025, but this indicator still roughly matched its average level over the previous decade.<sup>21</sup> As of mid-2025, global greenfield FDI was growing faster than total capital expenditure.<sup>22</sup>

**FIGURE 3.8: CAPITAL PILLAR DEPTH INDICATORS**

### Complementary Measures of Foreign Direct Investment

The DHL Global Connectedness Index employs four complementary measures of foreign direct investment (FDI). The most comprehensive measures are foreign direct investment flows and stocks, as measured in countries' official accounting of balance of payments and international investment positions. These data, however, are compiled with longer lags, and they can be skewed by financial transactions (often motivated by tax considerations) that do not necessarily reflect meaningful developments in the real operations or financial exposures of international firms or investors. According to one estimate, roughly 40% of FDI recorded in official statistics is “phantom FDI,” indicative of accounting transactions that do not meaningfully contribute to real economic integration.<sup>23</sup> Additionally, FDI flows do not capture international business expansions in which multinational firms secure local financing abroad.<sup>24</sup>

To address these limitations, recent editions of the DHL Global Connectedness Report devote substantial attention to measures of two components of FDI flows: announced mergers and acquisitions (M&A) transactions and announced greenfield FDI projects. Since these reflect business investments announced by firms, they directly track announced corporate expansion activity. Also, since these are tracked at the time of announcement, they provide an especially timely view of shifts in business behavior. However, these data also have important limitations, most notably that transaction values are often not public and that some announced transactions are ultimately cancelled or modified.

*FDI flows* include the value of greenfield FDI and cross-border M&A transactions, along with earnings companies reinvest abroad and some types of intra-company loans.<sup>25</sup> Thus, FDI flows provide a broader—though noisier—indicator of international business investment. Since 2018, FDI flows have fluctuated between 4% and 7% of global gross fixed capital formation, with no long-term rising or falling trend underway. FDI flows, however, do remain well below prior peak levels (see the box titled **FDI Weakness and Economic Development** on p. 37).

*FDI stocks* capture the value of multinational firms' cumulative investments over time in their foreign operations. The value of FDI stocks relative to world GDP rose sharply in the years before the Covid-19 pandemic and remains close to a record high.

*Portfolio equity investment* reflects holdings of less than 10% of the shares in a foreign company (above 10%, the investment is classified as FDI because the investor is presumed to have significant influence over the management of the foreign enterprise). After a long rising trend, the stock of portfolio equity investment assets (relative to world stock market capitalization) has remained fairly stable over the past decade.

Three broad patterns emerge from this set of capital flow indicators. First, the juxtaposition of long-run increases in FDI and portfolio equity stocks against declines in FDI flows and greenfield announcements highlights growth in the value of investments already held abroad even as new flows have softened. Second, while FDI flows and greenfield intensity sit below historical peaks, neither shows a sustained downward trend; they are volatile but broadly stable at lower levels. Third, the steady share of cross-border

### FDI Weakness and Economic Development

Economic development specialists have warned that weakness in global FDI flows constrains growth in low- and middle-income countries.<sup>26</sup> While recent indicators show no downward trend in FDI intensity, they do indicate that recent levels are substantially below the levels recorded earlier in the present century. Between 2001 and 2016, FDI flows averaged 9% of global gross fixed capital formation, well above the average of 6% since 2018. Average levels of capital expenditure on greenfield foreign direct investment declined even earlier, from an average of 1.6% between 2003 and 2009 to an average of 1.0% since 2010.

The volatile nature of FDI flows and several one-off factors warrant caution when comparing today's levels with past peaks. The 2015 peak in FDI flows was boosted by a wave of U.S. "corporate inversions." There is also some evidence that the rise of "digital" multinationals is undercounted in FDI statistics, since these firms do large amounts of business in foreign countries without investing in physical assets in those countries.<sup>27</sup> Moreover, policies aimed at reducing "phantom FDI" (financial transactions often motivated by tax policies that do not reflect real economic activity) appear to be achieving some success, reducing this component of measured FDI flows.<sup>28</sup>

Nonetheless, the sustained pattern of relatively lower levels of FDI in recent years does raise concerns for economic development, since there is strong evidence that FDI can accelerate economic growth. According to a 2025 World Bank study, a 10% increase in FDI flows in an average emerging economy is associated with a 0.3% increase in GDP after three years—and an even larger (0.8%) increase in "economies with greater trade openness, stronger institutions, better human capital development, and lower informality." The same study attributes today's subdued FDI outlook to "elevated trade tensions, policy uncertainty, and heightened macroeconomic and geopolitical risks."<sup>29</sup>

M&A transactions indicates no meaningful shift from foreign to domestic investment.

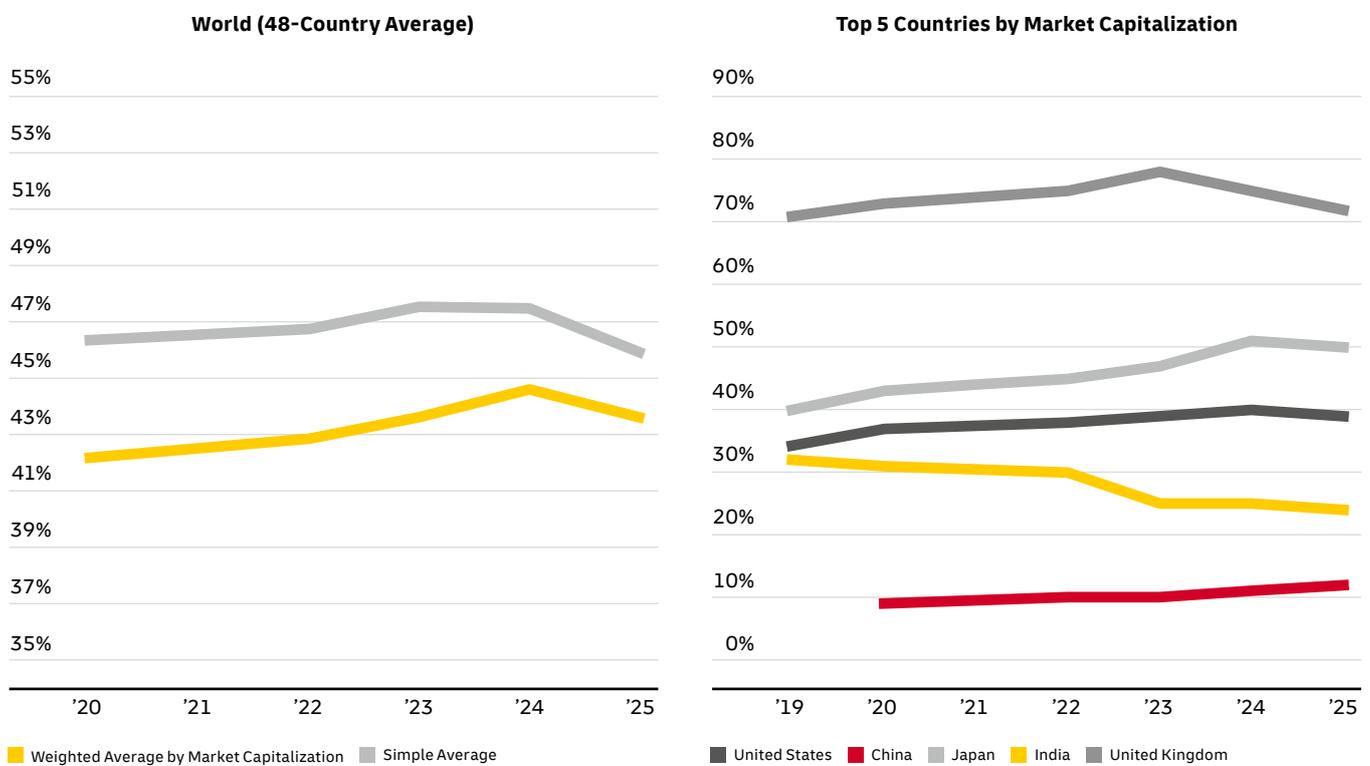

### Foreign sales stable globally, but diverge across major markets

Data on the foreign sales of multinational firms show no broad retreat from international business activity.<sup>30</sup> **Figure 3.9** tracks foreign sales as a percentage of total sales across Morningstar-indexed public companies in 48 countries representing 98% of global stock market capitalization from 2020–25. These foreign sales reflect both foreign operations (resulting from FDI) and export activity (trade).

In 2025, the global weighted average foreign-sales share (weighted by stock market capitalization) was 44%, down from a peak of 45% in 2024. On a simple average basis (more influenced by small country data), the average foreign-sales share in 2025 was 46%, down from a peak of 48% in 2023.

Levels and trends vary substantially across countries, even among the world's top five countries by stock market capitalization. Firms listed in the UK average the highest foreign sales share (72% in 2025), followed by Japan (50%), and the U.S. (39%). Across all three of these developed markets, the shares fell modestly over the past 1 to 2 years.

**FIGURE 3.9: PUBLIC COMPANIES' FOREIGN REVENUE SHARES**

**Publicly traded companies, on average, continued to earn close to the highest recorded shares of their revenues in international markets.**

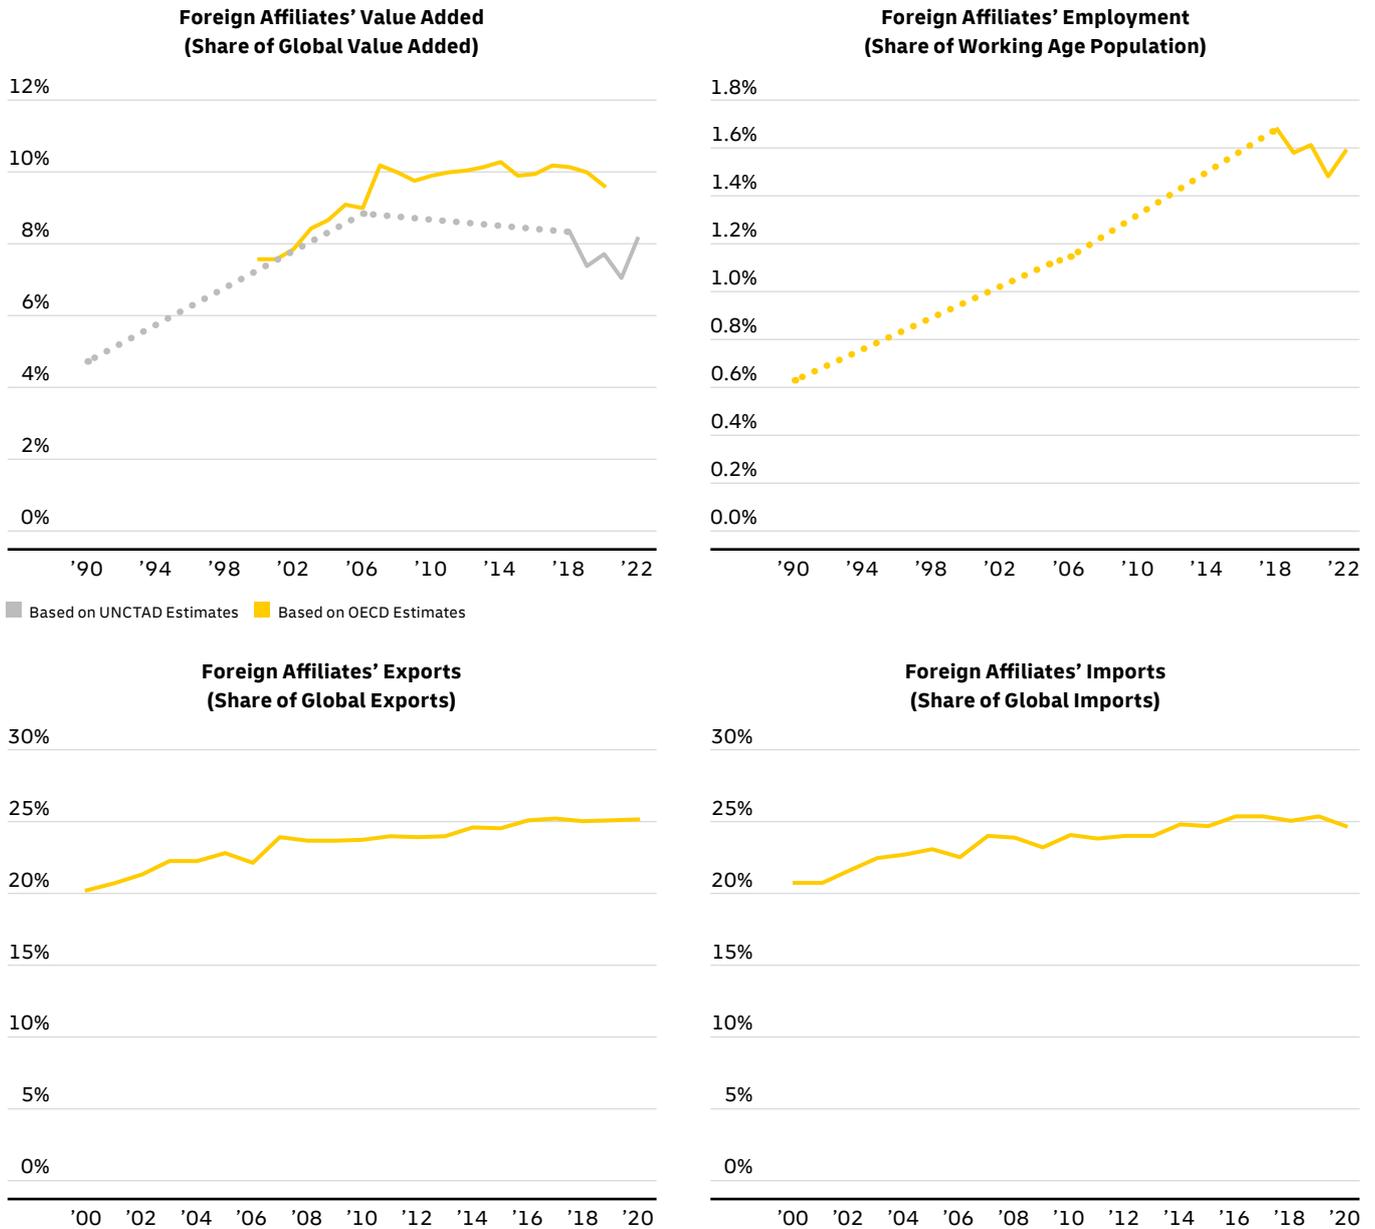

Data source: Morningstar Indexes Global Revenue Map, as reported in regular Morningstar publications by Dan Lefkowitz (2020, 2022, 2023, 2024, and 2025 editions).

By contrast, India’s foreign-sales share is lower (24%), and has fallen substantially from a level of 32% in 2019. India is the world’s fastest growing large economy, and companies listed there are earning a rising share of their sales at home. Finally, China has the lowest foreign-sales share (12% in 2025), but this has been on a continuous rising trend since 2020 (when it stood at only 9%). As China’s growth has slowed, companies based there have generated a rising share of their sales abroad.

**Multinational operations hold firm**

Data on the foreign operations of multinational companies also highlight the resilience of international business activity (see **Figure 3.10**). While these data provide a more direct view of the globalization of business firms, they are reported with longer lags. They are also generated using methods that require substantial estimation, implying that they should be treated as more approximate than other measures reported in this section.

**FIGURE 3.10: FOREIGN OPERATIONS OF MULTINATIONAL FIRMS**

**Data on the international operations of multinational firms reinforce the view that companies are not generally retreating from international markets. The value added, employment, and international trade generated by foreign affiliates of multinational firms remain near record highs.**  
 Data sources: UNCTAD World Investment Report (2022, 2023, 2024, and 2025 editions), OECD Analytical AMNE Database (2024 edition)

Recent studies estimate that the foreign operations of multinational firms generated 8–10% of all value added in the world economy—8% in 2022 according to UNCTAD’s World Investment Report and 10% in 2020 according to OECD’s Analytical AMNE database. The UNCTAD data show a modest decline from 9% in 2005–07 to 8% more recently, while OECD figures have held near 10% since 2007.

The share of the global working age population employed in the foreign operations of multinational firms peaked at an estimated 1.7% in 2018 and has since declined to 1.6% as of

2022. Meanwhile the share of global exports and imports generated by the foreign operations of multinational firms has remained steady at roughly 25% in recent years.

## INFORMATION FLOWS

Among all aspects of globalization covered by the DHL Global Connectedness Index, information flows saw the largest increases over the past quarter century. However, the latest data show declines on some indicators, raising questions about future prospects for the globalization of information flows.

### Massive data growth both domestic and international

The amount of data crossing national borders over the internet has more than quadrupled since 2019, fueling dramatic increases in international information flows. According to data from TeleGeography, the annual growth of international internet traffic spiked to 48% in 2020 and then continued at a 24% compound annual growth rate from 2021 to 2025.<sup>31</sup> Data flows, however, have surged both within and between countries, so the growth of international internet traffic does not itself demonstrate an increase in the internationalization of information flows. In fact, a McKinsey & Company study reported that the cross-border share of data flows fell 2% in 2022, after having grown substantially since 2012.<sup>32</sup> The DHL

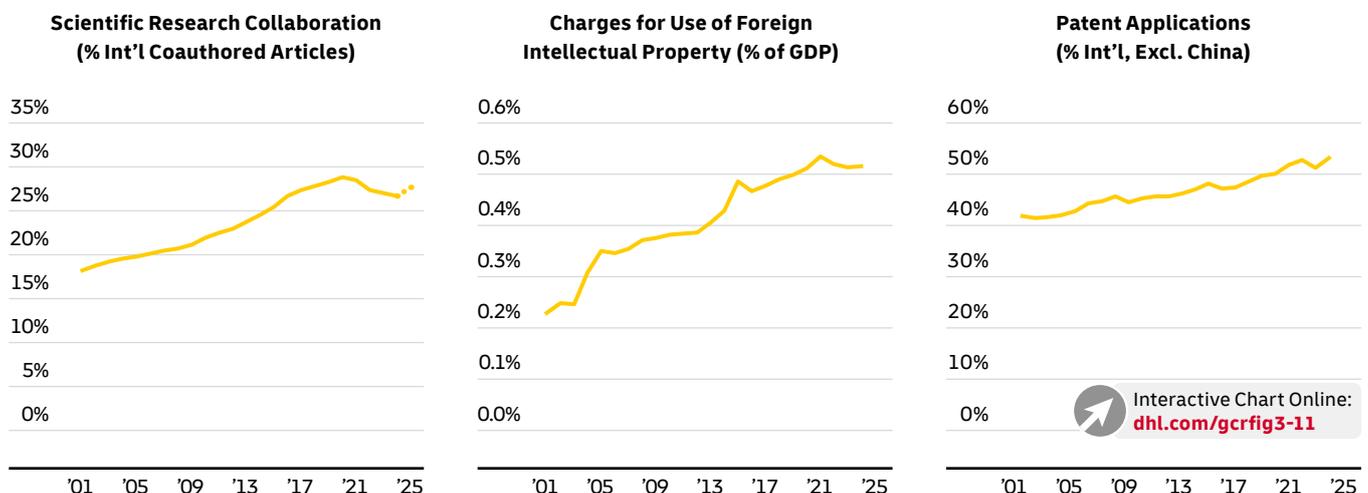

Global Connectedness Index relies on three indicators for assessing global trends in the balance of international relative to domestic information flows: scientific research collaboration, royalty charges for the use of intellectual property from other countries, and international patenting (see **Figure 3.11**).

### Rising global research tempered by reduced U.S.–China collaboration

International scientific research collaboration has increased dramatically over the past two decades.<sup>33</sup> The share of scholarly articles with coauthors based in multiple countries rose from 18% in 2001 to 29% in 2020, before slipping back to an estimated 28% in 2025.<sup>34</sup> The expansion of research collaboration has been driven by the growing scientific capacity of developing countries and advancements in online collaboration tools.<sup>35</sup>

The modest decline between 2020 and 2025 was partly due to a reduction in research collaboration between the U.S. and China, the countries with the largest output of scientific

**FIGURE 3.11: INFORMATION PILLAR DEPTH INDICATORS**

The intensity of international information flows has increased substantially over the past two decades. The most recent data indicate a stable level of international patenting (outside of China) but modest declines in international coauthorship of research articles and charges for the use of international intellectual property (as a share of GDP).

Data sources: Clarivate Web of Science, World Bank World Development Indicators, World Intellectual Property Organization (WIPO)

publications. We revisit this topic and consider the influence of geopolitical tensions in **Section 4**.

#### Small pullback in cross-border IP licensing

Payments for the use of foreign intellectual property rose steadily over a two-decade period, increasing from 0.23% of global GDP in 2001 to a peak of 0.53% in 2021, before easing to 0.52% in 2024. This pattern points to a major expansion of cross-border licensing as a business model, followed by a very modest pullback.<sup>36</sup>

#### International patenting sees post-2022 slowdown

There has also been a substantial increase in international patenting activity. Between 2001 and 2024, the share of patent applications filed by inventors outside the country of filing rose from 42% to 53%.<sup>37</sup> (We exclude China from this calculation due to data comparability concerns.)<sup>38</sup> While the most recent level on this measure is a record high, there has been a deceleration in the growth trend since 2022.

#### Corporate R&D also mixed

These mixed trends are paralleled in data on corporate research and development (R&D). The share of announced greenfield FDI projects focusing on R&D rose to a record high level of 9% in 2022 and stood at 7% in 2025 (January to August), above the 2003–20 average of 6%.<sup>39</sup> However, a recent study reports that the share of business R&D expenditure undertaken by the foreign affiliates of multinational firms peaked in 2013 and then declined until 2019.<sup>40</sup>

#### More countries tighten data rules

While these recent trend shifts cannot be directly tied to policy changes, it is notable that many countries have recently moved to restrict or regulate cross-border data flows. By early 2023, more than 40 countries had enacted data localization requirements.<sup>41</sup> Although motivations vary, research shows that these policies impose substantial costs on companies and can hinder trade growth.<sup>42</sup>

## INTERNATIONAL INFORMATION FLOWS VIA NEWS MEDIA

Direct contact between people living in different countries remains very limited. The vast majority of the world's population neither travel abroad in a given year nor communicate regularly with individuals in other countries by phone.<sup>43</sup> As a result, media remains the primary channel through which populations learn about and engage with the outside world.

Most media coverage, unsurprisingly, focuses on domestic news. Across a sample of 66 major newspapers from around the world, only about 15% of articles, on average, focused on international topics in 2022.<sup>44</sup> That share has been stable over the past decade but varies widely by publication—meaning the countries

readers learn about depend heavily on which outlets they choose.

Most people read news from domestic sources. Data from web-analytics provider Similarweb show that only 18% of traffic to online news websites, on average, comes from readers outside of the site's home country. Assuming online news websites mirror major newspapers in providing about 15% international coverage (according to our sample of 66 newspapers), roughly 30% of the news a typical reader sees is either about foreign countries or coming through foreign media. When people do visit foreign news sites, they typically favor those from nearby countries or those sharing their language.

## PEOPLE FLOWS

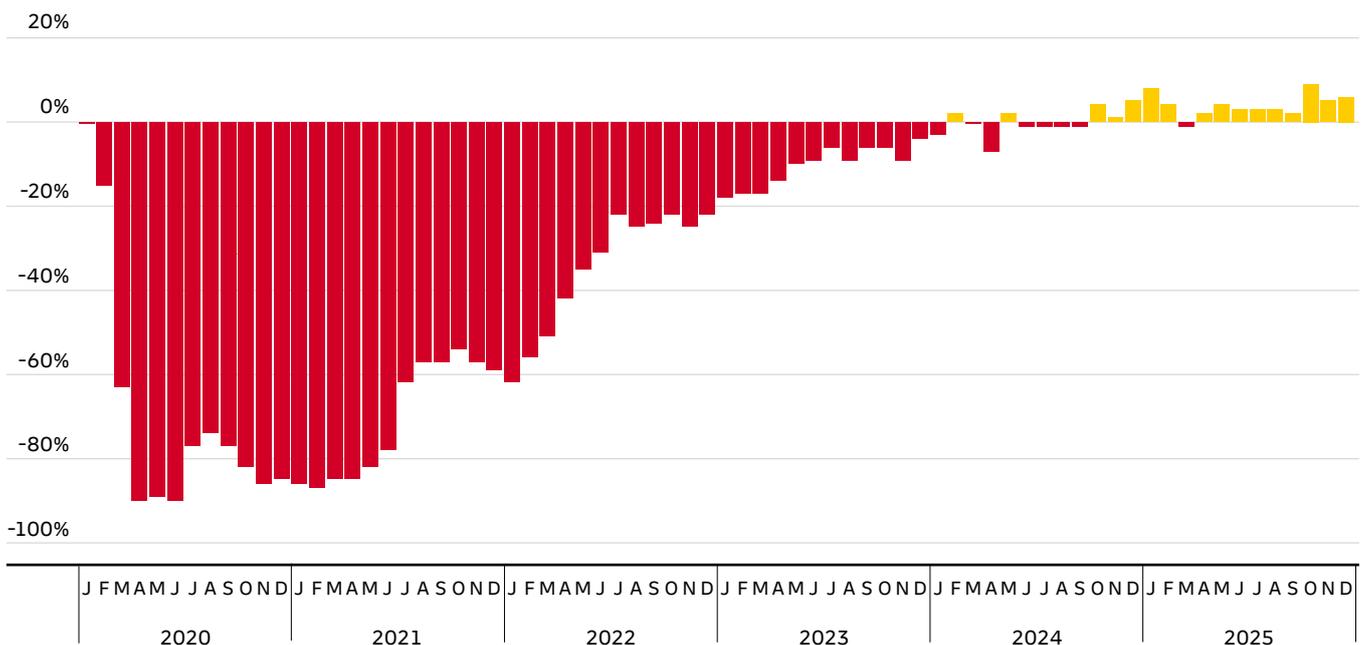

The Covid-19 pandemic affected people flows far more dramatically than other aspects of globalization, and restrictions on entry to the U.S. also feature prominently in the Trump Administration’s second term agenda.

### International travel roars back, but regions differ

International tourism has fully recovered after plummeting during the Covid-19 pandemic, as shown in **Figure 3.12**. In 2025, the number of people traveling to foreign countries surpassed pre-Covid (2019) levels in all months except March. On a per capita basis, international tourism is estimated to have returned to its 2019 level in 2025 (see **Figure 3.13**).

**FIGURE 3.12: INTERNATIONAL TOURIST ARRIVALS, CHANGE VERSUS 2019**

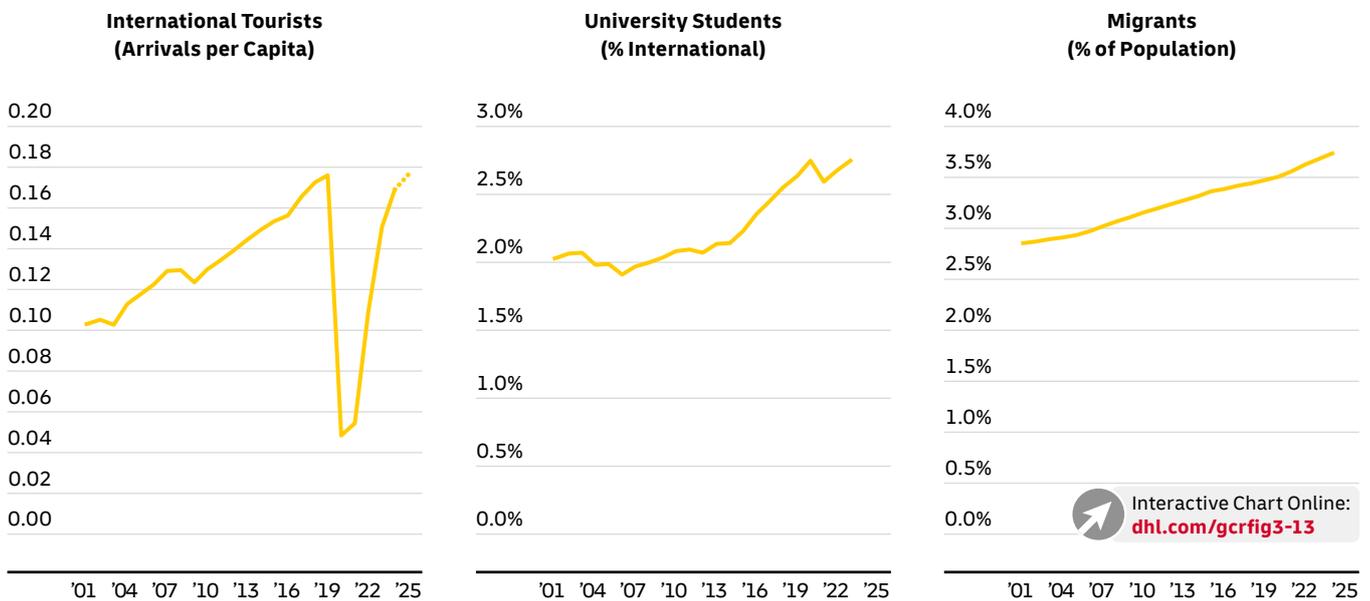

Efforts to contain the spread of the Covid-19 virus caused an unprecedented collapse of international travel. The number of people traveling to foreign countries did not surpass the pre-pandemic (2019) level on a consistent basis until 2025.

Data source: UN World Tourism Organization

**FIGURE 3.13: PEOPLE PILLAR DEPTH TRENDS**

The Covid-19 pandemic caused an unprecedented collapse of international travel, but its effects on international migration and education were much smaller. Data sources: Tourism Economics, UNESCO Institute for Statistics, UN DESA International Migration Database, UN DESA World Population Prospects

The strength of the travel recovery, however, has varied widely across regions. The region with the strongest growth in international arrivals has been the Middle East, where arrivals were up 39% in 2025 versus 2019 levels. Africa achieved the second largest increase (17%), while Europe also recorded a smaller (6%) increase. By contrast, arrivals remained well below pre-Covid levels in the Asia-Pacific region (down 9%) and were down modestly (1%) in the Americas.<sup>45</sup>

Domestic travel vastly outweighs cross-border travel. In 2019, only about 15% of travelers staying away from home for at least one night traveled internationally. Available data suggest that share dropped to roughly 10% in 2020 and recovered to 13% by 2022.<sup>46</sup>

**Student mobility rebounds, but key destinations turn more restrictive**

International student mobility has fully recovered from a modest pullback during the Covid-19 pandemic. By 2023 (the most recent data available), 2.8% of tertiary students were enrolled in degree programs outside of their home countries—the same peak level seen before the pandemic. This share had dipped slightly to 2.6% during the pandemic, far less than the collapse in international travel.

While global data for 2024 or 2025 are not yet available, data for leading study destinations suggest major shifts. The United States, the world’s top destination for foreign students, saw a 17% drop in new international student enrollments for the 2025–26 academic year.<sup>47</sup> A global university survey from August to October 2025 confirms a significant

drop in new foreign student enrollments in the U.S., and an even steeper drop in Canada.<sup>48</sup> Both countries have implemented more restrictive policies affecting inbound students.<sup>49</sup> Recent data also show declines in international enrollment in UK universities.<sup>50</sup>

By contrast, universities in other countries and regions saw rising foreign-student enrollments in August to October 2025,<sup>51</sup> led by strong gains in Asia and smaller increases in Europe. A recent study forecasts continued growth in international student mobility through 2030, with students spreading out across a wider variety of countries.<sup>52</sup>

### **Rising migrant stocks contrast with falling OECD immigration and transfers**

The final component of the people pillar is migration. Like international students, this measure represents the stock of migrants living abroad rather than the flow. The proportion of the world's population living outside of their birth countries has been on a rising trend over the past few decades. From 2001 to 2024, it rose from 2.9% to 3.7%, its highest level on record.

Annual flows of immigration into OECD member countries, however, declined 4% in 2024 following three years of strong post-Covid increases. Labor immigration saw a sharp 21% drop, while family migration—accounting for nearly half of permanent-type flows—declined 3%.<sup>53</sup>

Data on temporary migration for intra-company transfers shed light on mobility trends in multinational enterprises. There is a long-term decline in intra-company transfers into OECD countries, with a 3% decline from 2023 to 2024 (a third year of consecutive declines) and a cumulative reduction of 17% since 2015.<sup>54</sup>

Finally, the number of people who have been forcibly displaced from their homes, both within and across national borders, declined 5%—from a peak of 123 million at the end of 2024 to 117 million in June 2025.<sup>55</sup> This decline reflected the return of formerly displaced people to Afghanistan, the Democratic Republic of the Congo, Sudan and Syria (some returning under adverse circumstances). As of June 2025, roughly half of the world's forcibly displaced people remained within their home countries.<sup>56</sup>

**In summary,** the latest available data on international trade, capital, information, and people flows show no broad shift from international to domestic activity. In most areas, cross-border flows continue to grow roughly as fast as domestic flows, even as most activity still occurs within rather than between countries. Overall, the evidence strongly challenges the notion of a swing from globalization to deglobalization.

## WE DO NOT LIVE IN A HYPERGLOBALIZED WORLD

As we have seen in this section, international flows of many types are close to record high levels relative to domestic activity. Nevertheless, we do not live in a “hyperglobalized” world. Most activity that could happen either within or across national borders is still domestic, as shown in **Figure 3.14**.

The most recent available data show only 21% of all goods and services ending up in a different country from where they were produced.<sup>57</sup> Companies buying, building, or reinvesting in foreign operations via FDI accounted for only 6% of gross fixed capital formation. Just 18% of traffic to online news websites came from abroad. And just shy of 4% of people lived outside of the countries where they were born.

If many of these measures are lower than you expected, you are in good company. Surveys of managers, students, and the general public show that most people think international flows are larger than they really are.<sup>58</sup> This is a consistent pattern among respondents, regardless of their country, level of education, age, gender, or political leanings.

Such exaggerated perceptions of globalization can have real consequences. In business, people who overestimate globalization levels more than others tend to underestimate the challenges involved with doing business abroad. And in public policy, people who overestimate globalization levels tend to presume that globalization is a bigger factor in joblessness, wage stagnation, and climate change.<sup>59</sup>

**FIGURE 3.14: MOST FLOWS ARE PRIMARILY DOMESTIC RATHER THAN INTERNATIONAL, 2025 (OR MOST RECENT)**

**Most flows that could take place either within or between countries are still domestic rather than international.**  
 Data sources: Refer to Tables A.1 and A.2 in Appendix A.

An aerial night photograph of a complex highway interchange. The image is characterized by long-exposure light trails from cars, creating a dense network of white, blue, and red lines. A prominent yellow grid pattern is overlaid on the scene, with several bright yellow circular nodes at the intersections of the grid lines. The overall composition is dynamic and suggests a global or interconnected theme.

## 4. IS GEOPOLITICAL RIVALRY FRACTURING THE GLOBAL ECONOMY?

Escalating geopolitical tensions and active conflicts have fueled concerns that the global economy could fragment into rival blocs, threatening vital economic linkages. U.S.–China ties are weakening, and the EU–Russia relationship has fractured since the full-scale invasion of Ukraine. Yet, despite these shifts, global flow patterns remain broadly intact. Most countries continue to engage with their traditional partners, and the world remains very far from dividing into fully separate blocs along geopolitical lines.

## THE GEOPOLITICAL THREAT TO GLOBALIZATION

The number of state-based armed conflicts around the world has risen to the highest level since World War II—a stark indicator of heightened threats to one of globalization’s core foundations: peace and security.<sup>1</sup>

The Global Peace Index measures how secure countries and territories are, using regularly updated evaluations of various factors that reflect both peace and conflict.<sup>2</sup> There is a strong positive relationship between countries’ scores on the Global Peace Index and their levels of globalization as measured on the DHL Global Connectedness Index. More peaceful countries are more active in all kinds of mutually beneficial exchange, while dangerous environments prove to be a powerful disconnecter, cutting countries off from international opportunities.<sup>3</sup>

Conflicts not only disrupt global trade and investment directly; countries can also use their economic ties as tools to pressure or hurt each other. Interdependence, normally mutually beneficial, can be “weaponized” to harm a country’s interests.<sup>4</sup> In addition, research suggests an elevated risk of deglobalization during periods of hegemonic decline or transition.<sup>5</sup>

Several recent studies point to early signs of what the IMF calls “gloeconomic fragmentation,” marked by international trade and investment increasingly following countries’ geopolitical alignments. IMF and WTO analyses, for example, show that since Russia’s full-scale invasion of Ukraine, trade between rival geopolitical blocs has grown more slowly than trade within them.<sup>6</sup> This research warns that deeper fragmentation could have severe economic consequences. One study estimates that a complete split of world trade into two rival blocs could reduce world GDP by as much as 7%.<sup>7</sup>

### Global fragmentation remains limited despite high-profile geopolitical rifts

The extent of such fragmentation, however, is still very limited. Direct U.S.–China ties continue to weaken and there has been a profound split between Russia and Western-aligned economies, but most of the world has not substantially reoriented its international activity along geopolitical lines—at least not yet.

## MAJOR U.S.–CHINA SEPARATION WITH ACCELERATED TRADE DECOUPLING IN 2025

For a big-picture view of how U.S.–China ties have weakened since 2016 (before the start of the U.S.–China trade war during President Trump’s first term), **Figure 4.1** provides measures of each country’s share of the other’s international trade, capital, information, and people flows.<sup>8</sup>

### U.S.–China flow shares down 35–45%

There is a consistent pattern of both the U.S. and China conducting less of their flows with each other. The share of U.S. flows involving China declined for 9 out of the 11 types of flows shown on Figure 4.1, from an average of 9.3% in 2016 to 5.4% in 2025 (or the most recent year with data available).<sup>9</sup> While that represents a decline, on average, of only about four percentage points (small in relation to the U.S.’s total flows with the world), it is a substantial 42% drop in the share of U.S. flows involving China over less than a decade.

China’s share of flows involving the U.S. began—and remains—higher than the U.S. share involving China, but it also declined sharply. This measure fell for 9 out of the 11 flows analyzed, from an average of 17.7% in 2016 to 11.2% in 2025 (or the most recent year with data available). This

represents a drop of roughly six percentage points and a 37% decline relative to the 2016 share of China’s flows involving the U.S.<sup>10</sup>

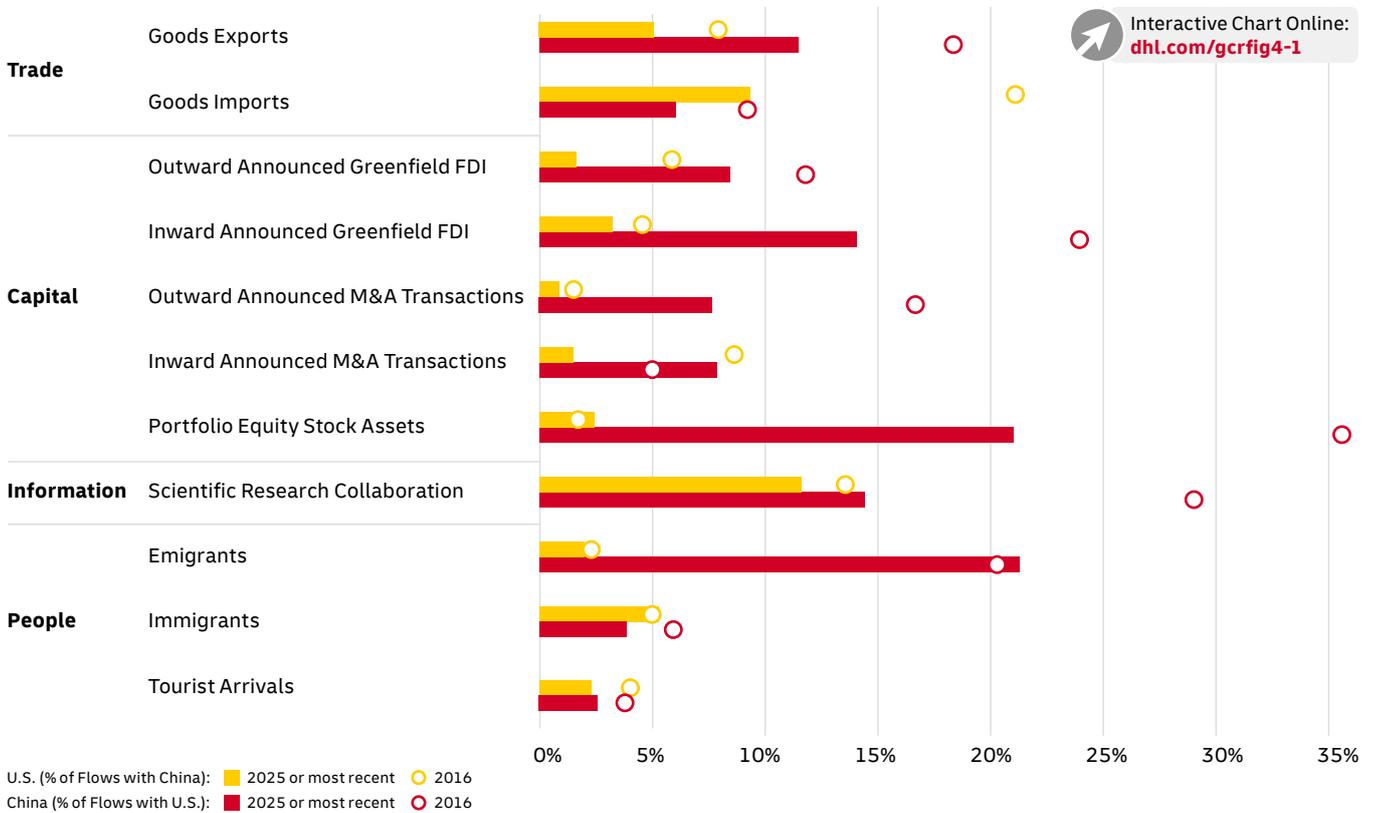

Thus, in broad brushstrokes, the U.S. and China are roughly 35–45% less focused on flows with each other today than they were in 2016.

A closer look at selected flows suggests that geopolitical tensions have driven only part of the post-2016 shift away from U.S.–China activity (see **Figure 4.2**). For trade and scientific research collaboration, geopolitics does appear to be the key factor in shifting patterns; for greenfield FDI and M&A activity, broader economic forces appear to play a larger role.

### Trade: clear policy-driven decoupling

The top two panels of Figure 4.2 highlight the diminishing direct trade ties between the U.S. and China (for a rough view of the role of indirect trade, refer to the box titled **U.S. Continued Reliance on Goods From China** on p. 52). The timing of the goods trade declines is especially notable. The share of U.S. imports coming from China stopped growing after 2015 (coinciding with the election of Donald Trump as

**FIGURE 4.1: U.S.–CHINA FLOW SHARES WITH EACH OTHER, 2025 (OR MOST RECENT) VS. 2016**

Interactive Chart Online:  
[dhl.com/gcrfig4-1](https://dhl.com/gcrfig4-1)

**The U.S. and China have reduced the share of their international flows involving each other since 2016 across nearly all types of trade, capital, information, and people flows.**

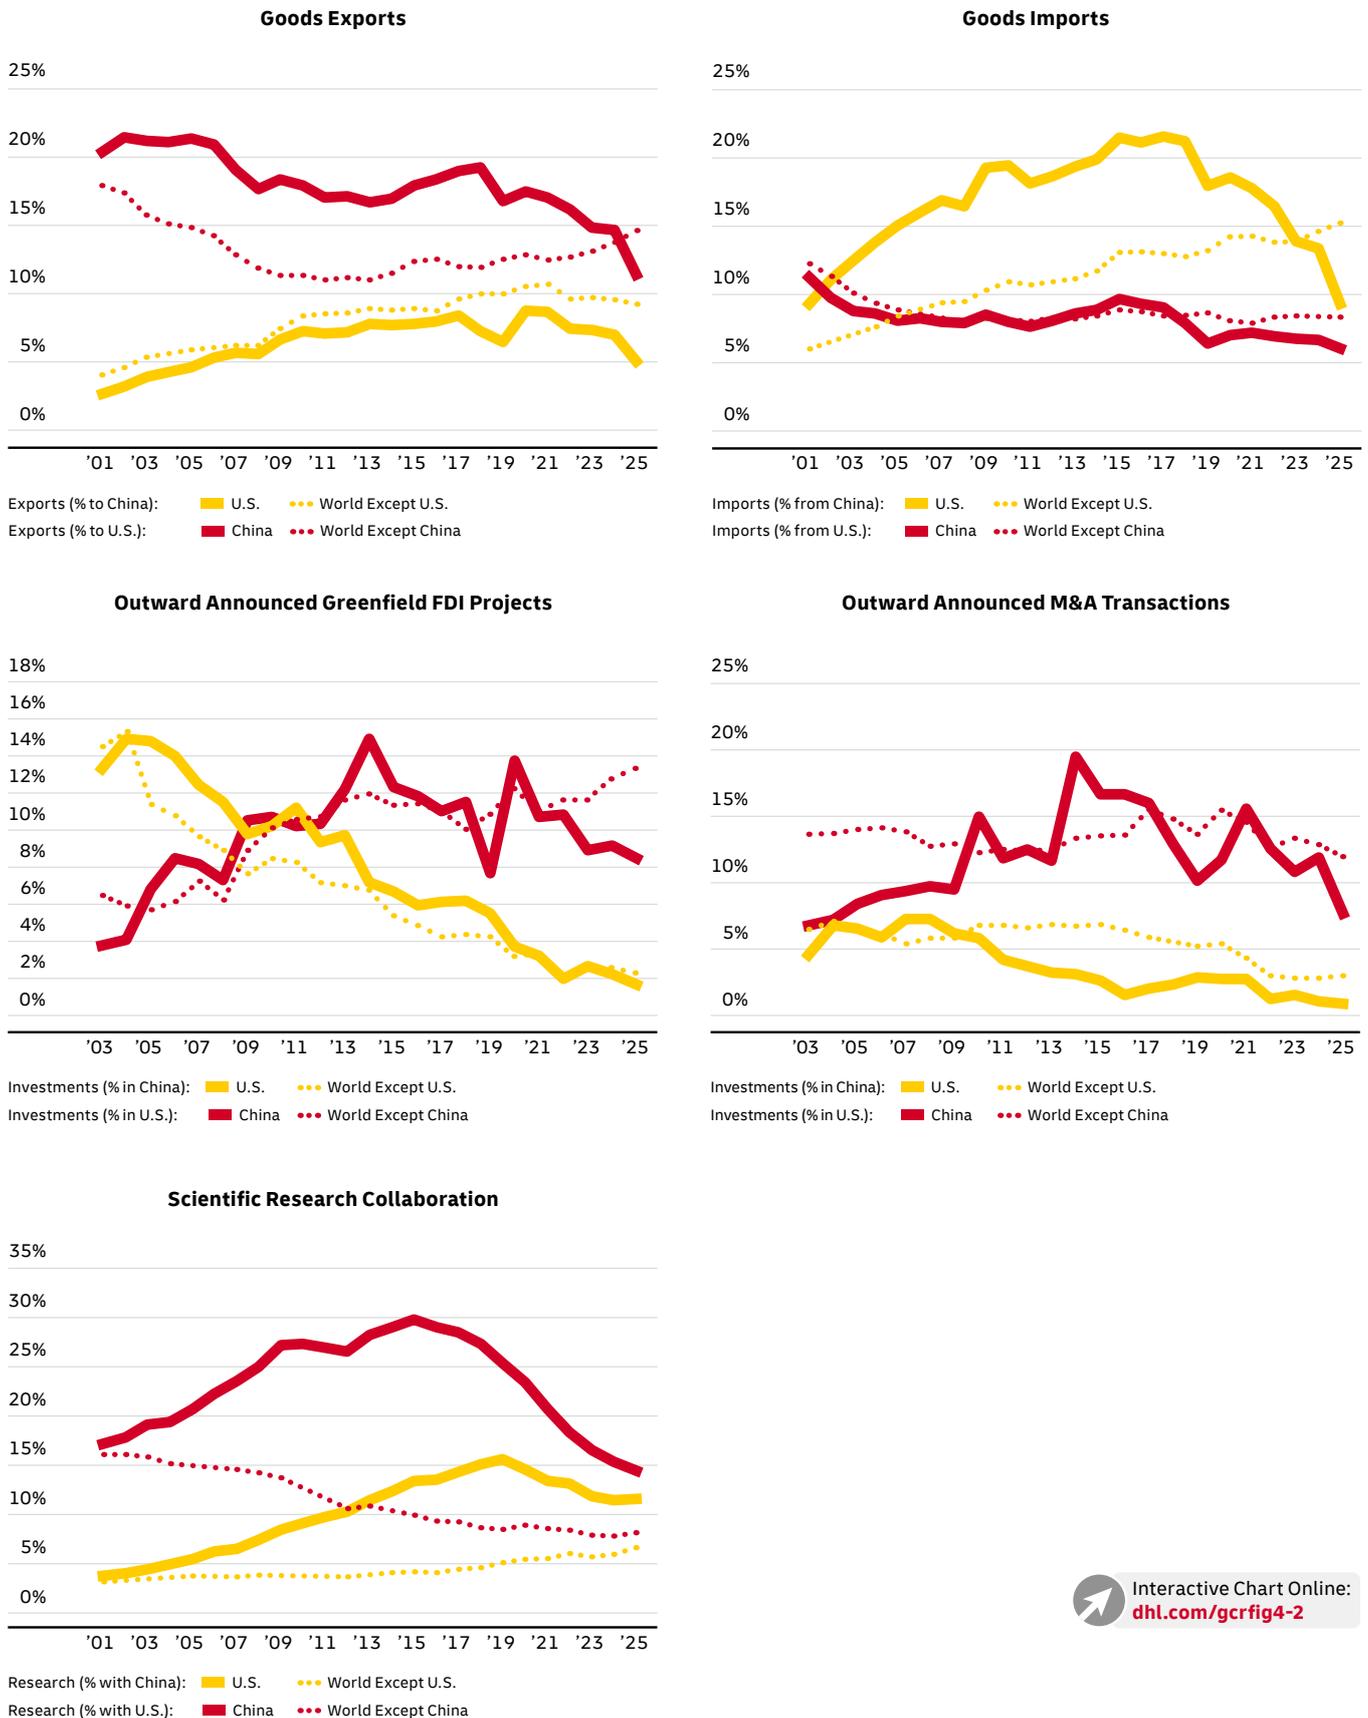

Data sources: IMF International Trade in Goods, Financial Times fDi Markets, LSEG SDC Platinum, IMF Portfolio Investment Positions by Counterpart Economy, Clarivate Web of Science, UN DESA International Migrant Stock, Tourism Economics.

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

This chart measures the percent of the U.S.’s flows that are to or from China (yellow bars and circles), and the percent of China’s flows that are to or from the U.S. (red bars and circles). The bars reflect the most recent available measures (based on 2025 data in most cases), and the circles show measures as of 2016. When the bars do not extend as far to the right as the circles, the countries have become less focused on flows with each other.

**FIGURE 4.2: U.S.–CHINA FLOW SHARES WITH EACH OTHER VERSUS WITH REST OF WORLD**

Interactive Chart Online:  
[dhl.com/gcrfig4-2](https://dhl.com/gcrfig4-2)

**Geopolitically-driven shifts away from U.S.–China trade and scientific research collaboration have been apparent for several years. 2024–25 data also point to geopolitically-driven shifts away from U.S.–China greenfield foreign direct investment and M&A activity.**

Data sources: IMF International Trade in Goods, Clarivate Web of Science, Financial Times fDi Markets, LSEG SDC Platinum

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

U.S. President in 2016) and began declining after the start of the U.S.–China trade war in 2018. It fell from a peak of 22% in 2017 to 13% in 2024 before dropping further to only 9% over the first nine months of 2025.

Likewise, the share of China’s imports coming from the U.S. started to decline after 2015 (from 10%) and then dropped sharply in 2018 and 2019, before stabilizing at 6–7%. While the share of China’s imports coming from the U.S. only declined modestly in 2025, the share of U.S. exports going to China fell more sharply.<sup>11</sup>

The dotted lines in Figure 4.2 show that the rest of the world’s trade with the U.S. and China did not decline alongside the drop in direct U.S.–China trade (solid lines). This is consistent with the idea that the shrinking shares of trade taking place directly between the U.S. and China reflect geopolitical tensions and policy actions, not a broader pullback by these countries from global trade. Other research has also found that tariffs imposed during this period did indeed play a significant role in redirecting U.S.–China trade flows.<sup>12</sup>

#### **Long-run investment decline not mainly due to U.S.–China tensions**

The picture for greenfield FDI and M&A is more nuanced.<sup>13</sup> There are long-run declines in the shares of both types of U.S. international business investment going to China, but there are also similar downward trends for the rest of the world’s investment in China. This suggests the long-run reduction in U.S. investment in China reflects China’s falling share of inward investment more than constraints due specifically to U.S.–China tensions.

By contrast, there is stronger evidence of unusual shifts away from U.S.–China business investment in 2025, most prominently in the measures of outward investment from China. The U.S.-bound shares of China’s outward greenfield FDI and M&A transactions both declined, while the U.S. share of the rest of the world’s outbound greenfield FDI has increased and its share of outbound M&A has remained relatively stable.<sup>14</sup> U.S. outbound business investment shows a similar pattern, but with smaller shifts. The shares of U.S. outward greenfield FDI and M&A going to China both declined, while the share of the rest of the world’s outward greenfield FDI going to China fell by a smaller amount and the share of the rest of the world’s outward M&A going to China held steady.

The solid lines on Figure 4.2 show the percentage of U.S. flows that are with China (in yellow) and the percentage of China’s flows that are with the U.S. (in red). Downward sloping solid lines indicate declining flow shares. The dotted lines provide context for the solid lines by showing the share of the rest of the world’s flows that are with the same country as the corresponding solid lines. For example, the dotted yellow line on the top-right panel puts the share of U.S. imports coming from China (the solid yellow line) in context by showing the share of the rest of the world’s imports

coming from China. Downward sloping solid lines that are not accompanied by similar declines in the dotted lines indicate reductions that are not also apparent for the rest of the world, which may suggest geopolitically driven shifts. The fact that the share of U.S. imports coming from China (solid yellow line) declined substantially since 2017, while the share of the rest of the world’s imports coming from China (dotted yellow line) rose, suggests a unique role of geopolitical tensions (and related policies such as tariffs) in reducing the flow of goods from China to the U.S.

## U.S. CONTINUED RELIANCE ON GOODS FROM CHINA

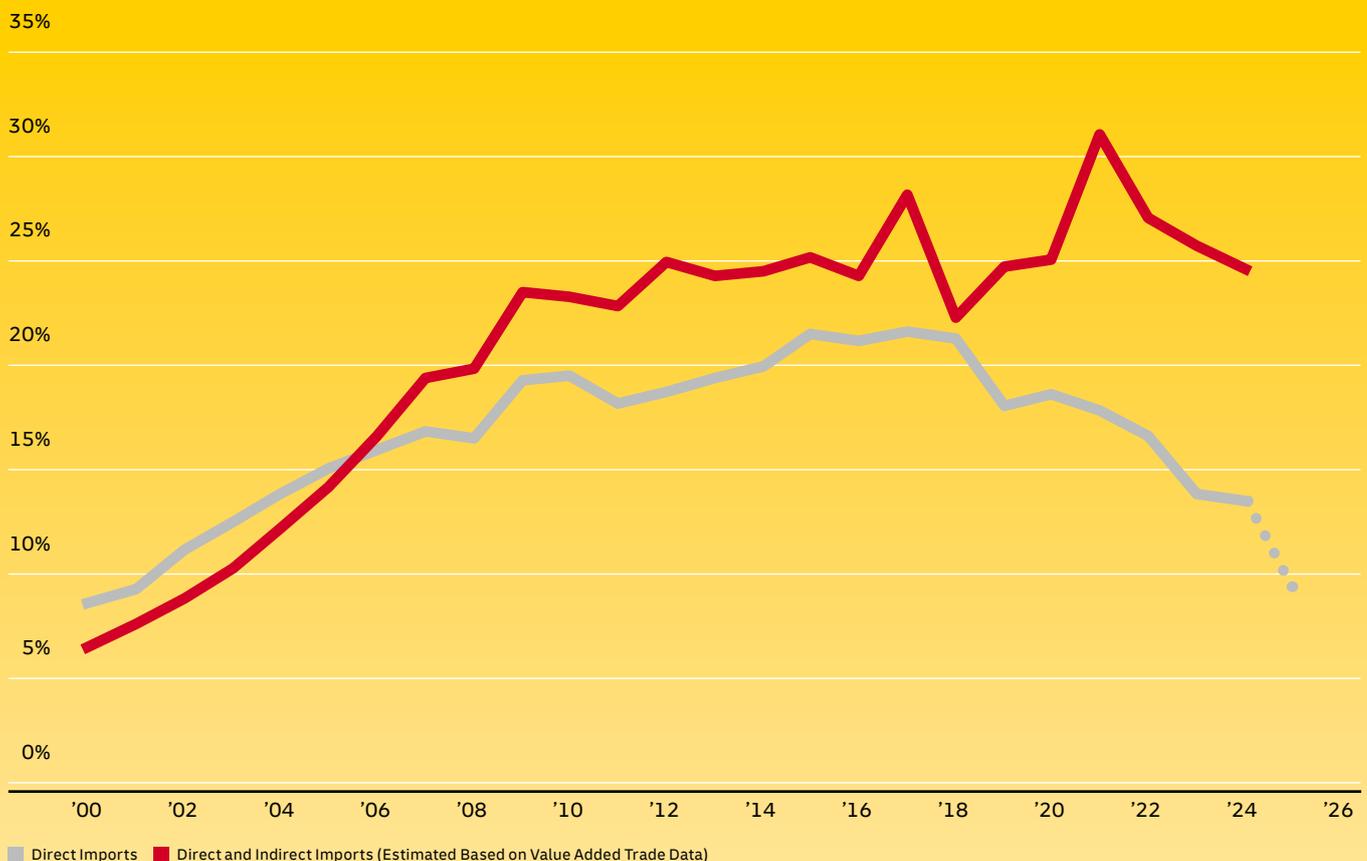

The declining share of U.S. imports coming from China (shown in Figure 4.2) should not be taken as compelling evidence that the U.S. has substantially reduced its reliance on goods from China, because goods the U.S. imports from other countries contain rising amounts of Chinese content.

The standard U.S. imports data used in Figure 4.2 and in the gray line in **Figure 4.3** consider only imports coming *directly* from China to the U.S., ignoring the value of Chinese inputs embedded in goods imported from other countries. As China has become increasingly competitive as a producer of intermediate goods, production in other countries has become increasingly reliant on inputs from China. Also, there is evidence that U.S. tariffs on imports from China have redirected trade via third countries.<sup>15</sup>

For a more comprehensive view of U.S. reliance on Chinese goods, the red line in Figure 4.3 tracks China's share of all foreign content ("value added") from goods production that is ultimately consumed in the U.S., regardless of whether it is imported directly or as an input to an import from another country.<sup>16</sup> It shows no meaningful reduction in U.S. reliance on content originating in China. The latest value (from 2024) is roughly back to its pre-pandemic level (after a spike during the pandemic). While this measure relies on far more estimation than direct-import data (making it more approximate), it suggests that the U.S. did not significantly reduce its reliance on Chinese content between 2018 and 2024.

Trade data in value added terms are not yet available for 2025, but estimates indicate that indirect Chinese exports to the U.S. have risen sharply following additional tariff increases. According to a study by Capital Economics, the value of such indirect exports grew so large by mid-2025 that it modestly surpassed the value of direct exports from China to the U.S.<sup>17</sup>

**FIGURE 4.3: ALTERNATIVE MEASURES OF CHINA-ORIGIN SHARE OF UNITED STATES GOODS IMPORTS**

**When considering both direct and indirect imports, China's share of all foreign content from goods production used in the U.S. economy had not declined substantially by 2024, the most recent year with data available.**

Data sources: IMF International Trade in Goods, UN Comtrade, Asian Development Bank Multiregional Input Output Tables.

Note: 2025 data cover January to September only.

### **Dramatic drop in research collaboration**

The decline of scientific collaboration between the U.S. and China is even more dramatic than the declines in trade and investment—and not paralleled in patterns for these countries' research with the rest of the world. The share of internationally coauthored scientific publications with at least one author based in China that also involved at least one author based in the U.S. fell by more than half, from 30% in 2015 to 14% in 2025. There was a somewhat smaller decline in the share of U.S. coauthored publications involving collaborations with China-based researchers (from 16% in 2019 to 12% in 2025), due to China's rising share of global scientific output.<sup>18</sup>

### **U.S.–China ties still rank among the world's largest**

Before looking beyond the U.S. and China, it is worth underscoring the substantial ties that still bind these economic giants. Their combined trade, capital, information and people flows remain larger than those of almost any other country pair—surpassed only by the U.S. with Canada, Mexico, and the UK, and by China with its special administrative region of Hong Kong.<sup>19</sup>

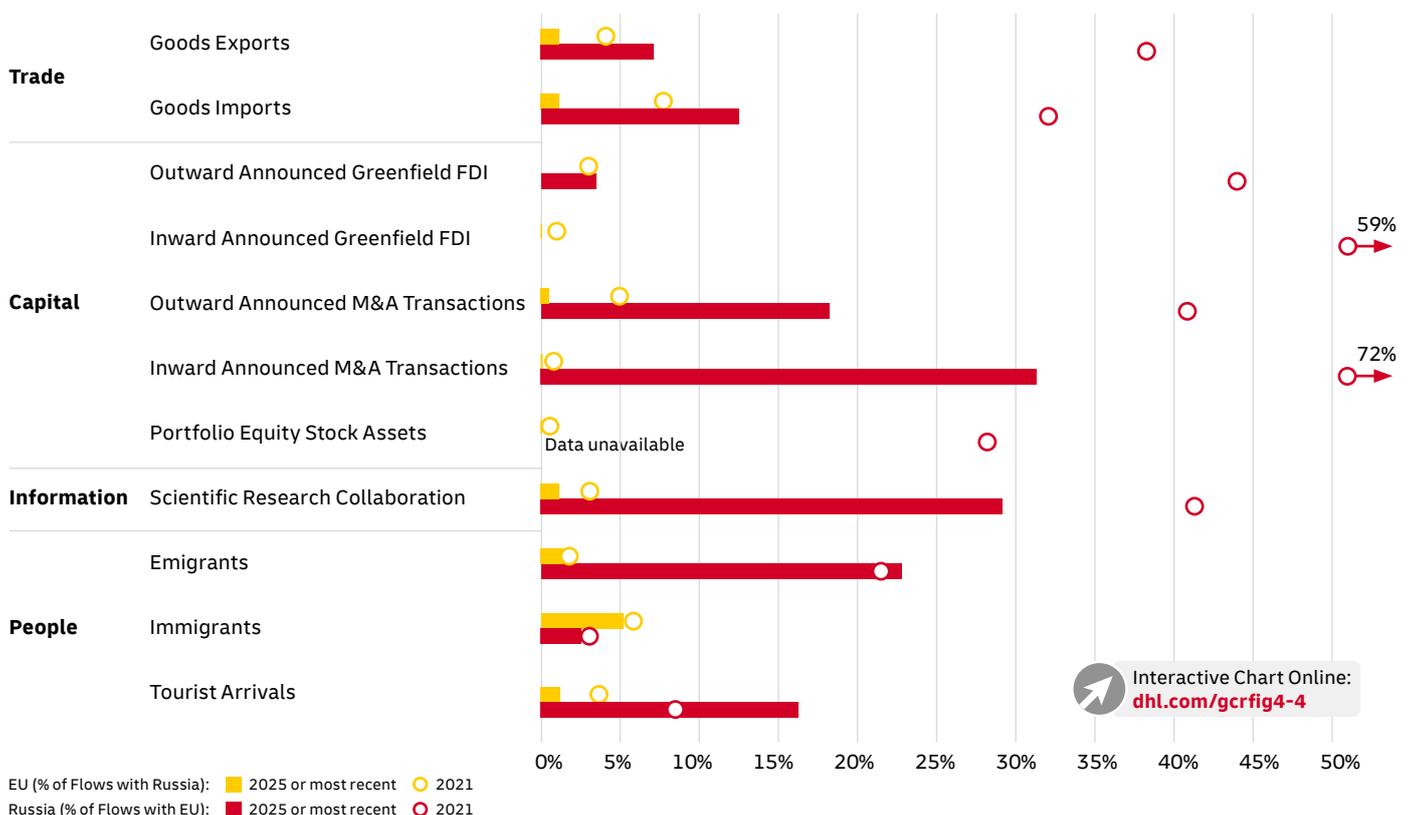

## LARGER EU-RUSSIA BREAKUP SINCE FULL-SCALE INVASION OF UKRAINE

Compared to the U.S.–China flows we have just examined, Russia’s international flows have shifted far more dramatically since its full-scale invasion of Ukraine in February 2022. Before the war, the EU was Russia’s top partner for most flow types, with shares approaching or even exceeding half of Russia’s total global flows. In 2021, for example, 72% of Russia’s inward M&A transactions and 59% of Russia’s inward announced greenfield FDI projects came from investors based in the EU, while 38% of Russia’s goods exports went to the EU.

### Profound EU–Russia split since 2021

Figure 4.4 shows the collapse of EU–Russia ties since 2021 across 11 types of international activity. In less than four years, the share of Russia’s flows to or from the EU has fallen by 62%, while the share of EU flows to or from Russia plummeted by 74%. Unsurprisingly, military conflict and sweeping sanctions have triggered a far more abrupt and profound break between Russia and the EU than the gradual U.S.–China separation driven by geopolitical tensions and tariffs.

FIGURE 4.4: EUROPEAN UNION–RUSSIA FLOW SHARES WITH EACH OTHER, 2025 (OR MOST RECENT) VS. 2021

EU–Russia ties have collapsed since the full-scale invasion of Ukraine in 2022.

Data sources: IMF International Trade in Goods, Financial Times fDi Markets, LSEG SDC Platinum, IMF Portfolio Investment Positions by Counterpart Economy, Clarivate Web of Science, UN DESA International Migrant Stock, Tourism Economics.

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only. Intra-EU flows excluded.

## THE WORLD ECONOMY HAS NOT SPLIT INTO SEPARATE GEOPOLITICAL BLOCS

While countries at the center of current geopolitical conflicts have substantially reduced ties with their rivals, the world is still very far from a global split into separate geopolitical blocs. On a global basis, fragmentation or fracturing of the world economy along geopolitical lines is still quite limited.

### Shifts away from rival blocs remain small

For a global perspective on international business ties, **Figure 4.5** provides a breakdown of global flows, distinguishing between those directly between the U.S. and China, those crossing between rival blocs allied with each superpower, flows within each bloc, and flows involving countries aligned with neither superpower. Geopolitical groupings are according to Capital Economics' classifications as of January 2025 (see **Country Blocs and Geopolitical Distance** on p. 57). The U.S.-aligned bloc includes the U.S. and its "close allies"—such as major European economies, Japan, Australia, and Canada. The China-aligned bloc includes China and "close allies" such as Russia, Iran, Pakistan, and a variety of smaller economies, mainly in Africa and Asia.

Recent shifts away from business between geopolitical rivals are surprisingly small from a global perspective. Direct U.S.–China goods trade has fallen from a peak of 3.6% of

global trade in 2015 to 2.0% in 2025 (January–September), and trade between rival blocs of "close allies" of the U.S. and China has fallen from 12.6% to 10.2% over the same period. In total, those numbers indicate that about 4% of global trade has shifted away from rival blocs over the past decade.

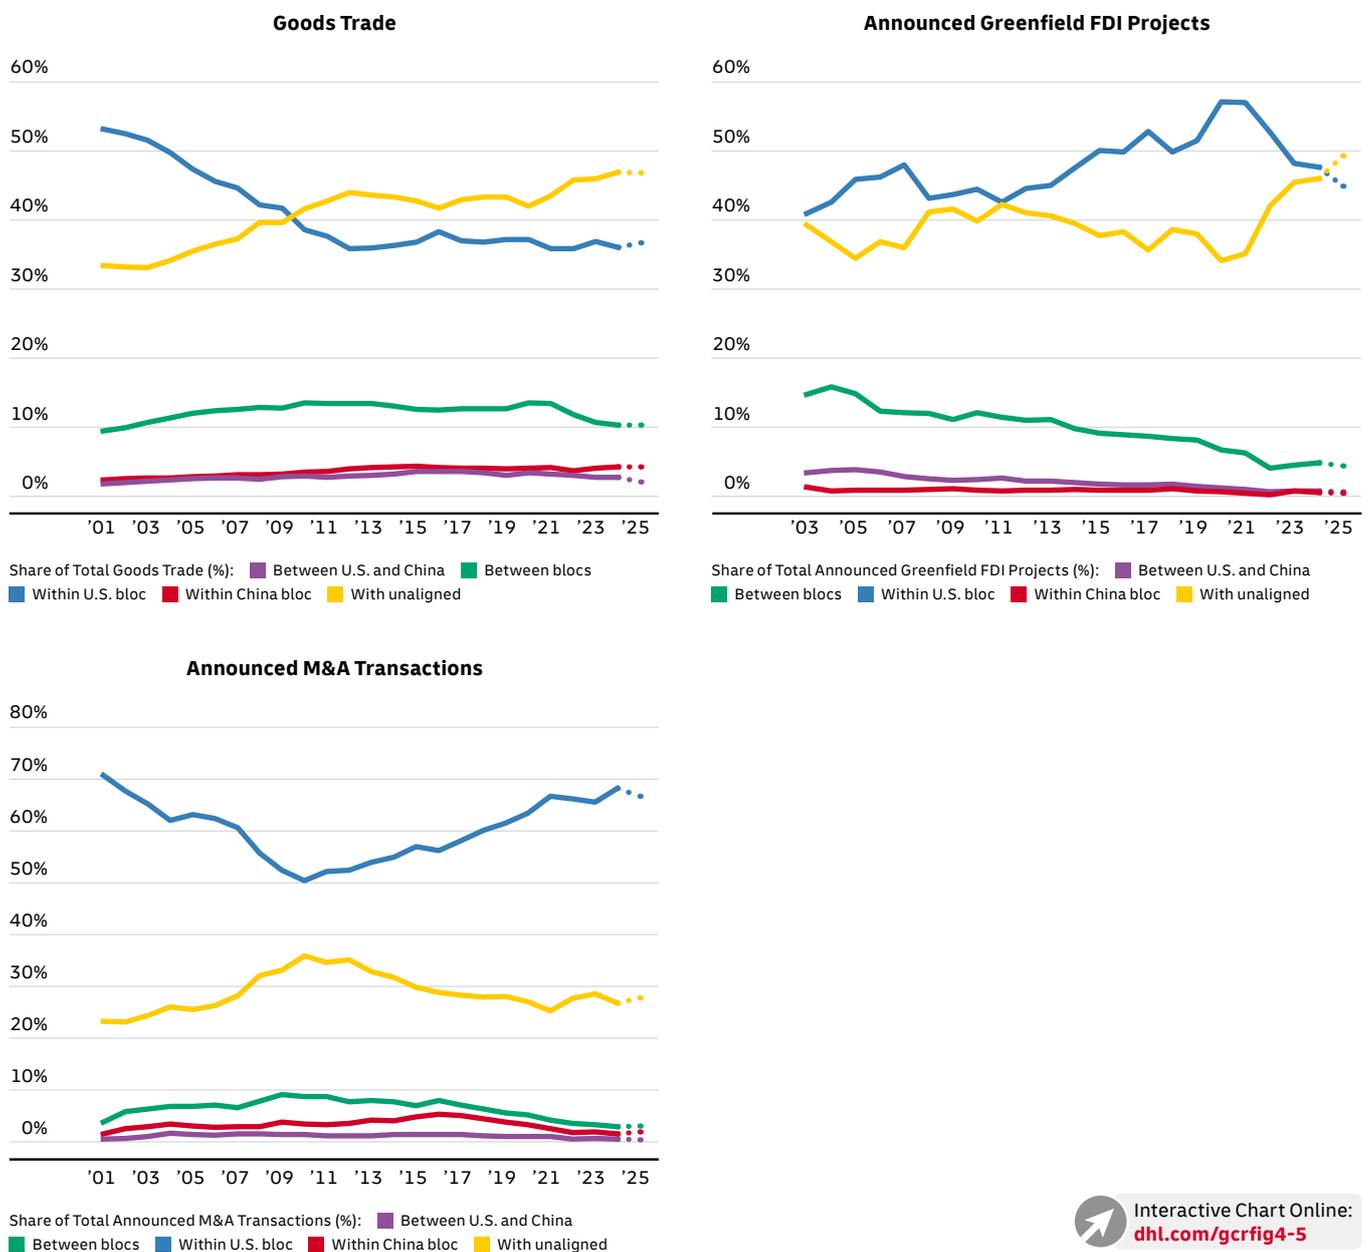

Shifts in global announced greenfield FDI and M&A away from geopolitical rivals are slightly larger, but still only about 5% to 6% of total global activity. Notably, greenfield investment between rival blocs of close allies has increased modestly since 2022.

### Global business mainly among allies and neutral countries, not rivals

Figure 4.5 also highlights how little global business occurs between geopolitical rivals. The shares of greenfield FDI and M&A activity between rival geopolitical blocs are already minimal, leaving little room for further declines to impact global business patterns. In 2025, only 3.5% of M&A transactions and 5.1% of greenfield projects took place between the U.S. and China or their close allies.

Most international business already takes place between friendly countries. In 2025, there was three times more goods trade among close allies than there was between countries in rival geopolitical blocs, along with nine times more announced greenfield FDI projects and 20 times more M&A deals. Figure 4.5 shows that the share of global business taking place inside blocs of close allies is holding steady since 2022 for trade and M&A activity and declining for greenfield FDI, while activity involving "unaligned" countries has been rising. This pattern points more to "de-risking" than "friendshoring"—reduced exposure to rivals but not necessarily more reliance on close allies.

**FIGURE 4.5: SHARE OF TOTAL INTERNATIONAL FLOWS BETWEEN AND WITHIN BLOCS**

Interactive Chart Online: [dhl.com/gcrfig4-5](https://dhl.com/gcrfig4-5)

**Declines in the shares of global business crossing between blocs of close allies are still limited. Far more business already happens among friendly countries than between geopolitical rivals.** Data sources: IMF International Trade in Goods, UN Comtrade database, Financial Times fDi Markets, SDC Platinum  
 Note: Bloc classifications based on Williams, M., Evans-Pritchard, J., & Walsh, R., 2025. The Shape of the Fractured World in 2025. Capital Economics. 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

## COUNTRY BLOCS AND GEOPOLITICAL DISTANCE

The analysis of a potential split of the world economy along geopolitical lines requires measures of countries’ geopolitical alignment. We use two complementary methods: (1) a classification of country blocs as of January 2025 developed by Julian Evans-Pritchard and Mark Williams of Capital Economics<sup>20</sup> and (2) a continuous measure of geopolitical distance based on how countries vote in the United Nations General Assembly developed by political science scholars Michael Bailey, Anton Strezhnev, and Erik Voeten.<sup>21</sup>

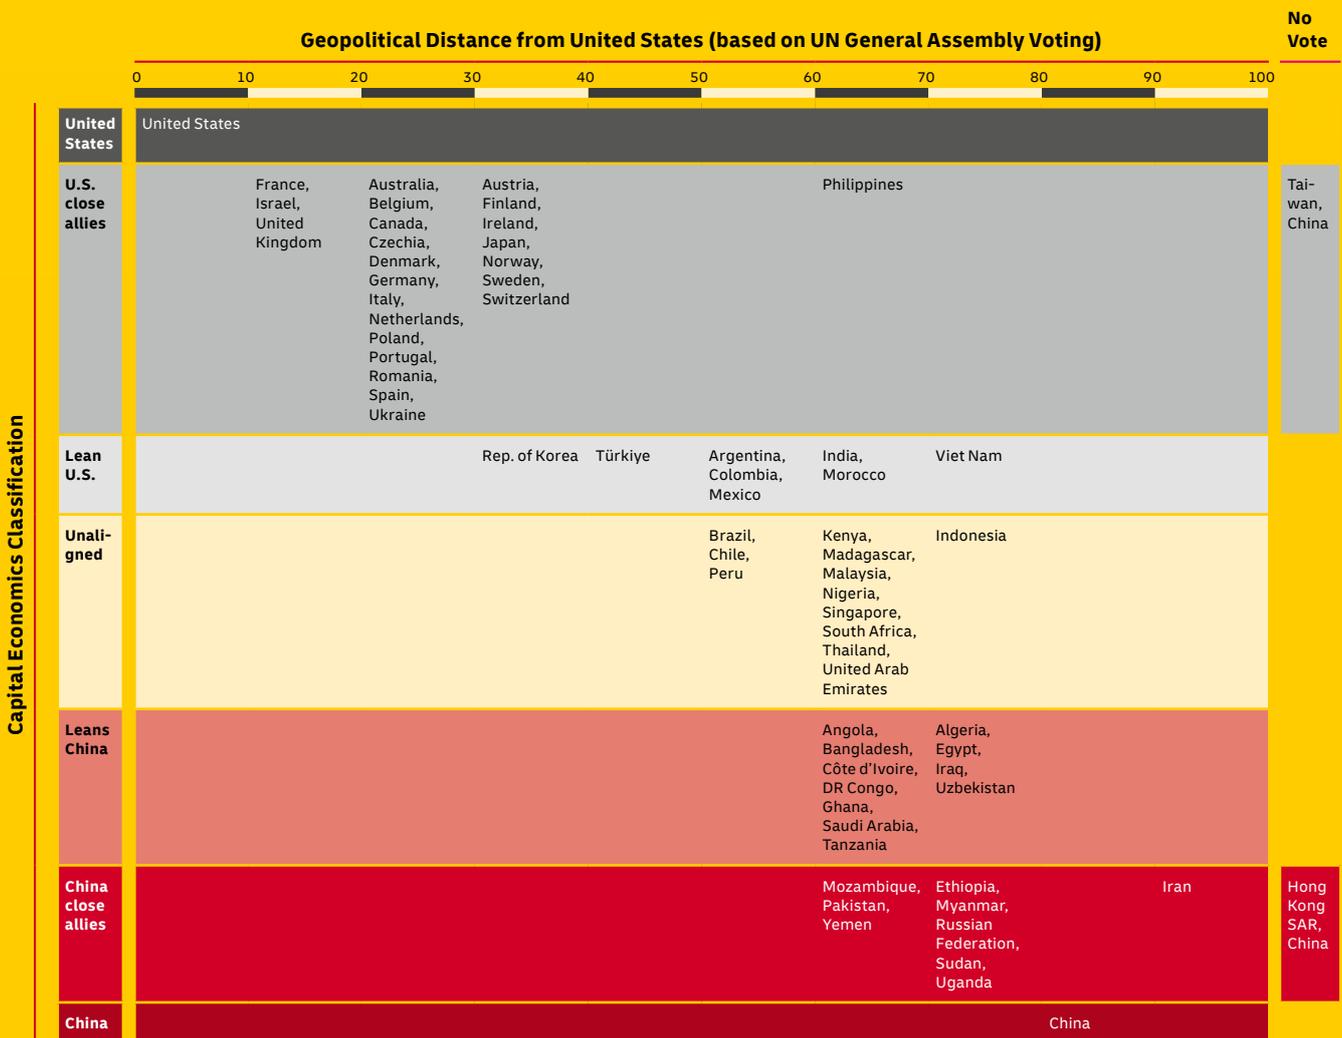

The Capital Economics classification is especially well suited to analysis of a split between blocs aligned with the U.S. and China because it reaches beyond measures commonly used in the academic literature to also take into account other factors, such as which countries have territorial disputes with China and which participate in major international initiatives led by the U.S. or China.<sup>22</sup>

The continuous geopolitical distance measure based on UN General Assembly votes is widely used (and also critiqued) in the academic literature, and has also been adopted by institutions such as the IMF in their research on geoeconomic fragmentation.<sup>23</sup> While several methods have been developed to

assess countries’ geopolitical alignment based on their votes at the UN, we selected this method for two main reasons: (1) it accounts for changes over time in the topics countries vote on, and (2) it has been designed to measure countries’ positions vis-à-vis the U.S.-led liberal international order. The distances shown here reflect the absolute value of the difference between countries’ “ideal points” (as revealed by the UN votes), averaged over the 5-year period 2019–23 and rescaled between 0 and 100.

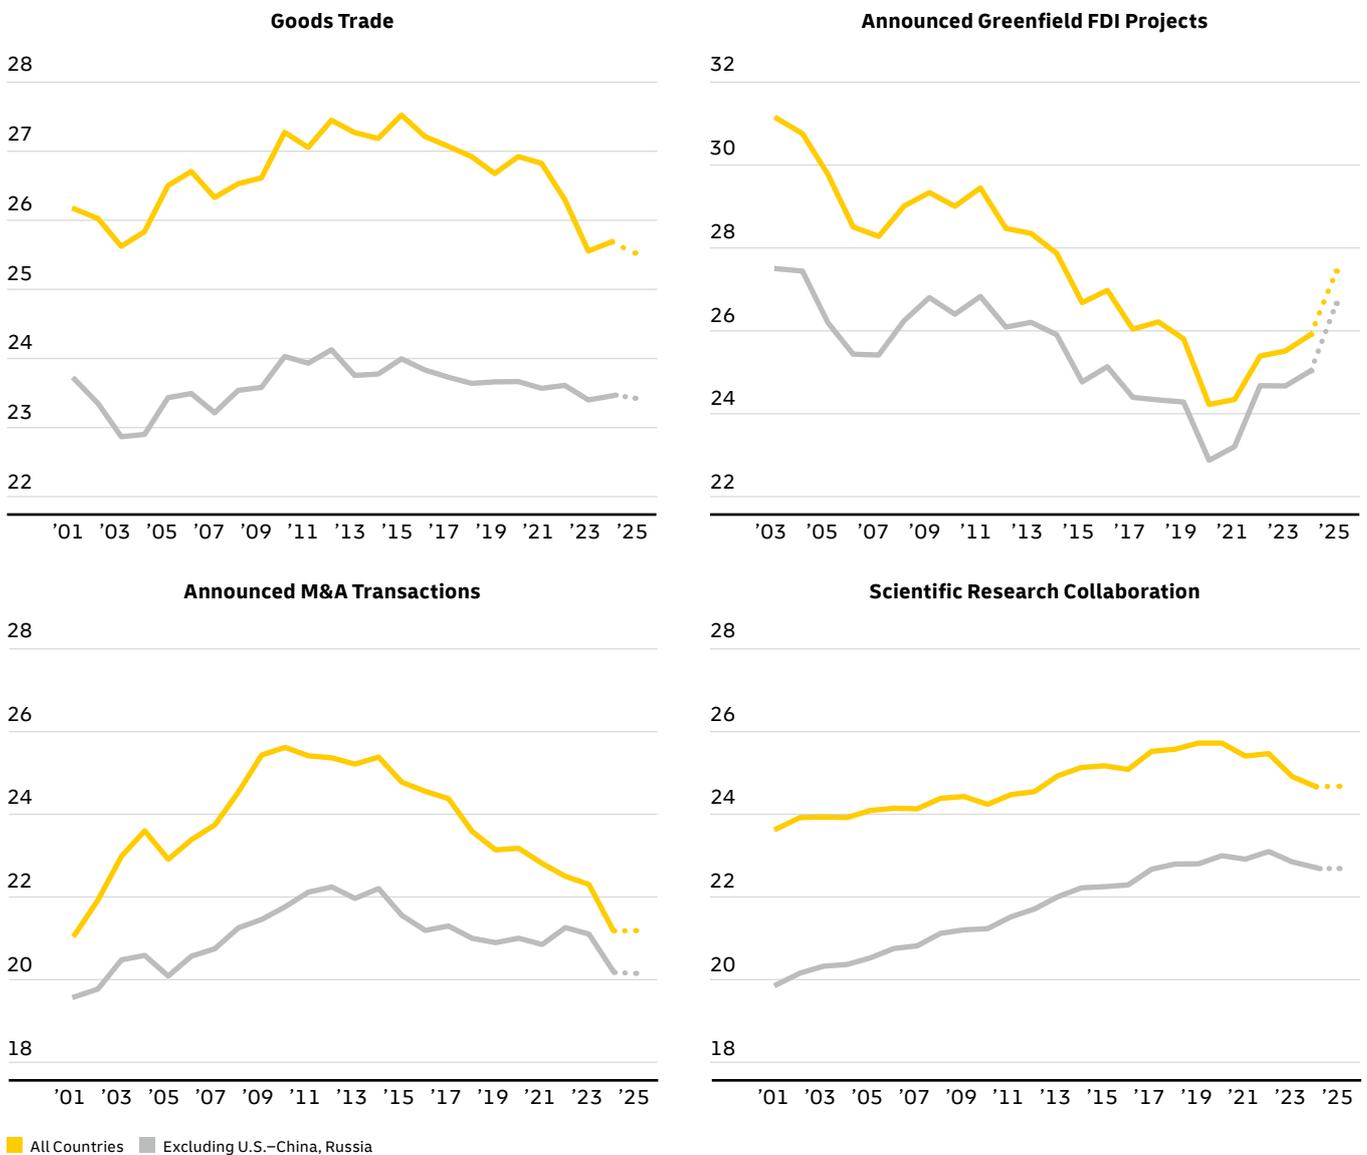

Increased tensions between the U.S. and its close allies in 2025 and early 2026 have fueled substantial discussion about the possibility of major changes to countries’ geopolitical alignments. The geopolitical alignment indicators employed here do not yet capture such developments.

The figure below shows how countries are positioned using both methods (displaying countries that rank among the world’s 50 largest by either GDP or population). Since we view a split between rival blocs as most likely to appear first among countries with stronger geopolitical ties, when we use the Capital Economics classification, we use blocs comprised only of “close allies,” treating all other countries as unaligned.

Note: Due to space constraints, this table only includes countries ranking among the world’s 50 largest by either GDP or population. Related analyses include all countries.

**FIGURE 4.6: AVERAGE GEOPOLITICAL DISTANCE BASED ON UN VOTING PATTERNS**

**Geoeconomic fragmentation trends for goods trade, M&A, and scientific research collaboration have been driven mainly by weaker U.S.–China ties and Russia’s break with Western-aligned countries, and these trends have not persisted in the most recent data.**  
 Data sources: IMF International Trade in Goods, UN Comtrade database, Financial Times fDi Markets, SDC Platinum. Note: Geopolitical distance calculated according to 2019–23 UN General Assembly votes (rescaled 0–100), based on the Ideal Point Distance measure from Bailey, Strezhnev, and Voeten (2017). Goods trade data for 2025 cover January to September only; 2025 announced greenfield FDI data cover January to November only. Calculations excluding U.S.–China, Russia (gray lines) exclude direct flows between the U.S. and China, as well as flows between Russia and all partner countries.

### Geopolitical distance based on UN voting patterns

Measures of the average geopolitical distance traversed by international flows—based on similarities in UN General Assembly voting—offer a complementary view of recent shifts.<sup>24</sup> Instead of a binary “ally vs. non-ally” classification, they place countries on a 0 to 100 continuum, providing a more nuanced read of geopolitical alignment. The drawback is that these measures are based solely on agreement on UN resolutions, which are only a limited proxy for underlying relationships between countries.

**Figure 4.6** shows the average geopolitical distance traversed by goods trade, greenfield FDI, M&A transactions, and scientific research collaboration. When geopolitical distance declines, this suggests geoeconomic fragmentation because flow patterns more closely follow countries’ geopolitical alignments (less with rivals and more with friendly or neutral countries).

### Fragmentation trends on pause

The average geopolitical distance traversed by all countries’ flows (shown in yellow in Figure 4.6) has declined since 2021 (before the full-scale invasion of Ukraine) for all of the flow types except announced greenfield FDI. This is consistent with the shifts away from flows between geopolitical rivals—small in global perspective—that we have already discussed. It is also notable that these trends have not persisted in the most recent data. The average geopolitical distance for goods trade fell sharply in 2022 and 2023, rose slightly in 2024, and then fell slightly in 2025 (January to September) back to roughly its 2023 level. For M&A and scientific research, prior declining trends did not continue in 2025.

### Greenfield FDI projects crossing longer geopolitical distances

A rising trend since 2021 in the average geopolitical distance for announced greenfield FDI contradicts the notion that companies are generally redirecting business expansion

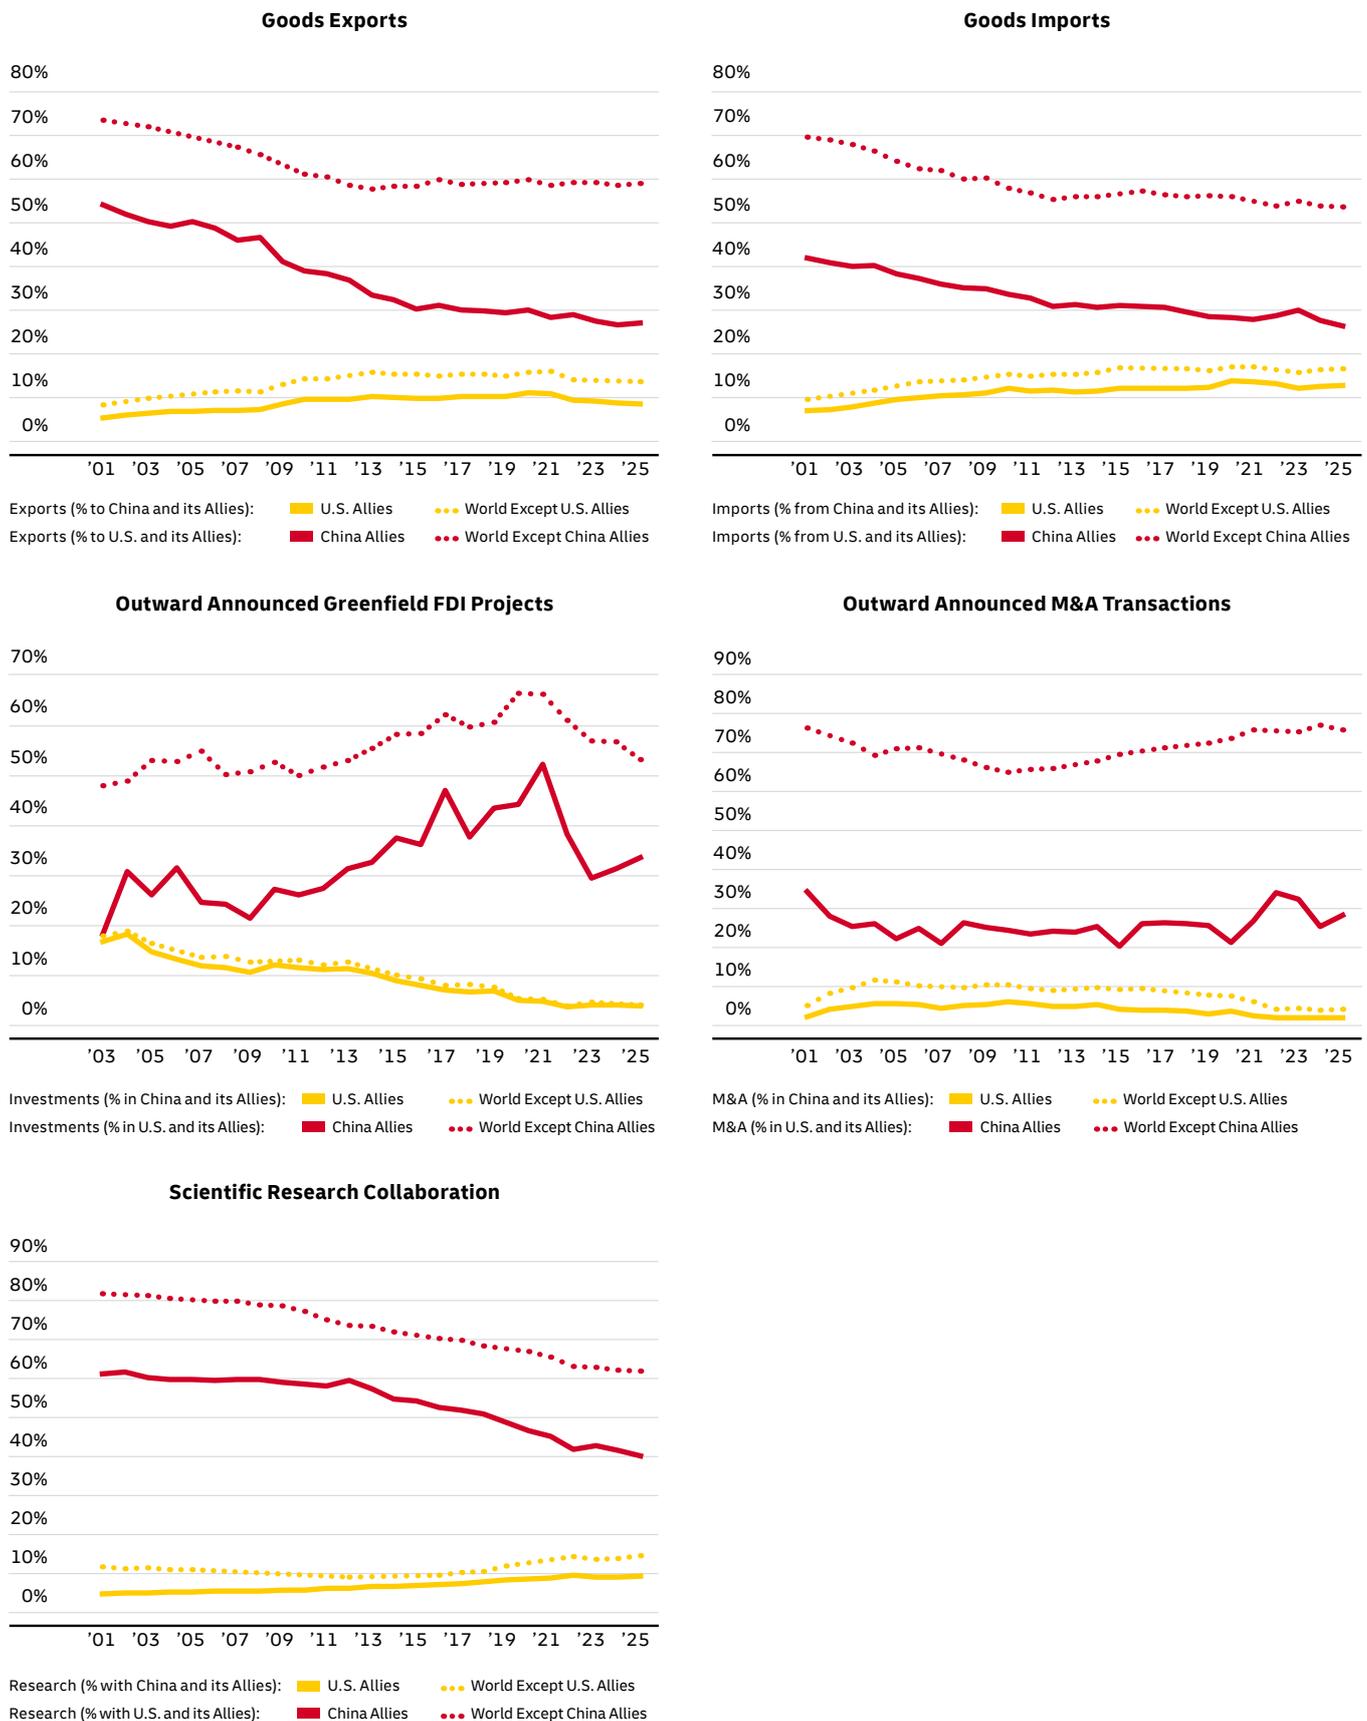

projects from adversaries to allies. The trends shown in Figure 4.5 help to explain this surprising result. Since 2021, the share of greenfield projects among U.S. close allies fell while the share with unaligned countries increased. As companies have diversified their expansion locations, they have often chosen countries with moderate rather than especially close geopolitical alignment. Increased investment by U.S. and EU companies in India and Viet Nam exemplify this pattern.

### Limited fragmentation beyond U.S., China, Russia

Most of the recently observed shifts toward shorter geopolitical distances were due to the weakening of U.S.–China ties and the break between Russia and Western-aligned countries shown earlier in this section. Excluding U.S.–China flows and all flows involving Russia (gray lines in Figure 4.6), the declines in average geopolitical distances since 2021 were much smaller (89% smaller for goods trade, 69% for scientific research collaboration, and 57% for M&A). For announced greenfield FDI, there was an even larger increase in average geopolitical distance when excluding these flows.

These results indicate that most of the recent realignments of international flows along geopolitical lines involve countries at the center of current tensions. Across the rest of the world, there is more limited evidence of geoeconomic fragmentation.

**FIGURE 4.7: ALLIED COUNTRIES FLOW SHARES TRENDS (EXCLUDING RUSSIA, U.S.–CHINA FLOWS)**

**Close allies of the U.S. and China show very little evidence of geopolitically-driven reductions in ties with countries in the rival bloc.**

Data sources: IMF International Trade in Goods, Clarivate Web of Science, Financial Times fDi Markets, LSEG SDC Platinum. Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only. Bloc classifications based on Williams, M., Evans-Pritchard, J., & Walsh, R., 2025. *The Shape of the Fractured World in 2025*. Capital Economics. Allies include only “close allies” as specified in this classification.

### Global allies aren't following the U.S.–China split

Comparing flow shifts among close allies with those in the rest of the world further underscores that the global economy remains far from splitting into isolated geopolitical blocs. **Figure 4.7** replicates the U.S.–China analysis from Figure 4.2 from the perspective of their close allies (excluding direct U.S.–China flows and all Russia-related flows to keep the dramatic shifts involving those countries out of the scope of this analysis).

The trends for U.S. close allies are especially striking. While the U.S. has sharply reduced its ties to China, U.S. allies show no similar pattern of disconnecting from China and its close allies (excluding Russia). U.S. close allies purchased a slightly higher share of their imports from China and its close allies in 2025 (January–September) than they did in 2023, and they maintained stable shares of greenfield FDI, M&A transactions, and scientific research collaboration with these countries. The only modest decline over that period was in the share of U.S. close allies' goods exports going to China and its close allies.

Trends for China's close allies are mixed, with modest declines in shares of goods trade and scientific research collaboration with the U.S. and its close allies, but higher shares of outbound M&A transactions going to the U.S. bloc than before the Covid-19 pandemic and no clear rising or falling trend for outbound greenfield FDI.

Overall, ties between blocs of close allies remain far more stable than those of the superpowers at the center of current conflicts. Even as ties between the world's largest economies have frayed, the data do not show a consistent pattern of separation between rival blocs of allied countries.

**In summary**, the U.S. and China have reduced their direct engagement, even as they remain connected by larger flows than nearly every other country pair. Russia's international flows have shifted dramatically since the full-scale invasion of Ukraine in early 2022. Nonetheless, these developments have not led to a wider split of the world economy into rival blocs. Geoeconomic fragmentation—which could have severe economic consequences—remains very limited from a global perspective.

# 5. IS GLOBALIZATION GIVING WAY TO REGIONALIZATION?

Geopolitical tensions and concerns about supply chain resilience have prompted many observers to predict a shift from globalization to regionalization. These predictions are not—at least yet—borne out in global patterns of international activity. This section examines regionalization by tracking the average distance traversed by international flows and the share of flows taking place within rather than between major world regions. It also examines reasons why we might see more regionalization in the future, along with factors constraining potential increases in regionalization.

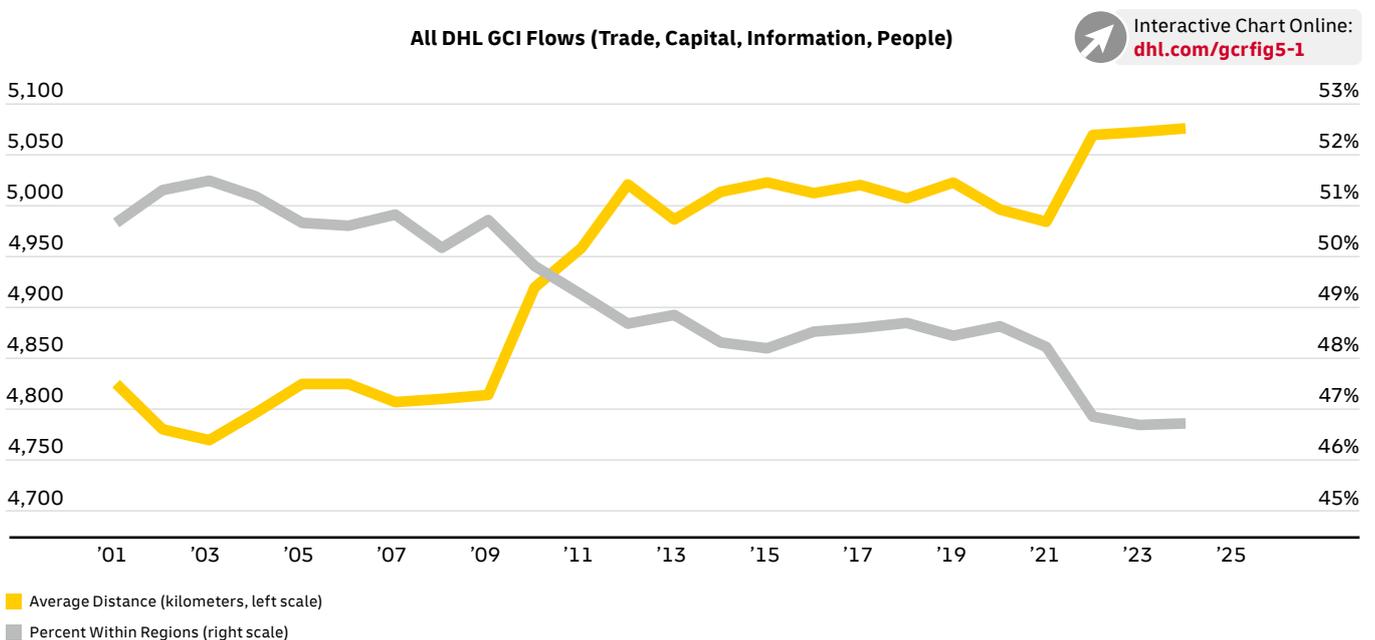

## INTERNATIONAL FLOWS CROSSING LONGEST DISTANCES ON RECORD

Even before recent increases in geopolitical tensions and supply disruptions, many experts predicted a shift from global to more regional business activity, with nearshoring strategies cutting the distances over which companies trade and invest.<sup>1</sup> The latest data, however, still show that international flows have not generally become more regionalized in recent years. The region definitions used in this section are reported in **Table A.4** in the Appendix.

**Figure 5.1** presents a big-picture perspective on regionalization, measuring the share of trade, capital, information, and people flows taking place inside major world regions (gray line) along with the average distance traversed by these flows (yellow line). The most recent data at this level of aggregation show the share of flows taking place within regions in 2024 to be very close to the record low (set in 2023), and they show international flows traversing the longest distance on record.

**FIGURE 5.1: DHL GLOBAL CONNECTEDNESS INDEX AVERAGE DISTANCE AND REGIONALIZATION TRENDS, 2001 – 2024**

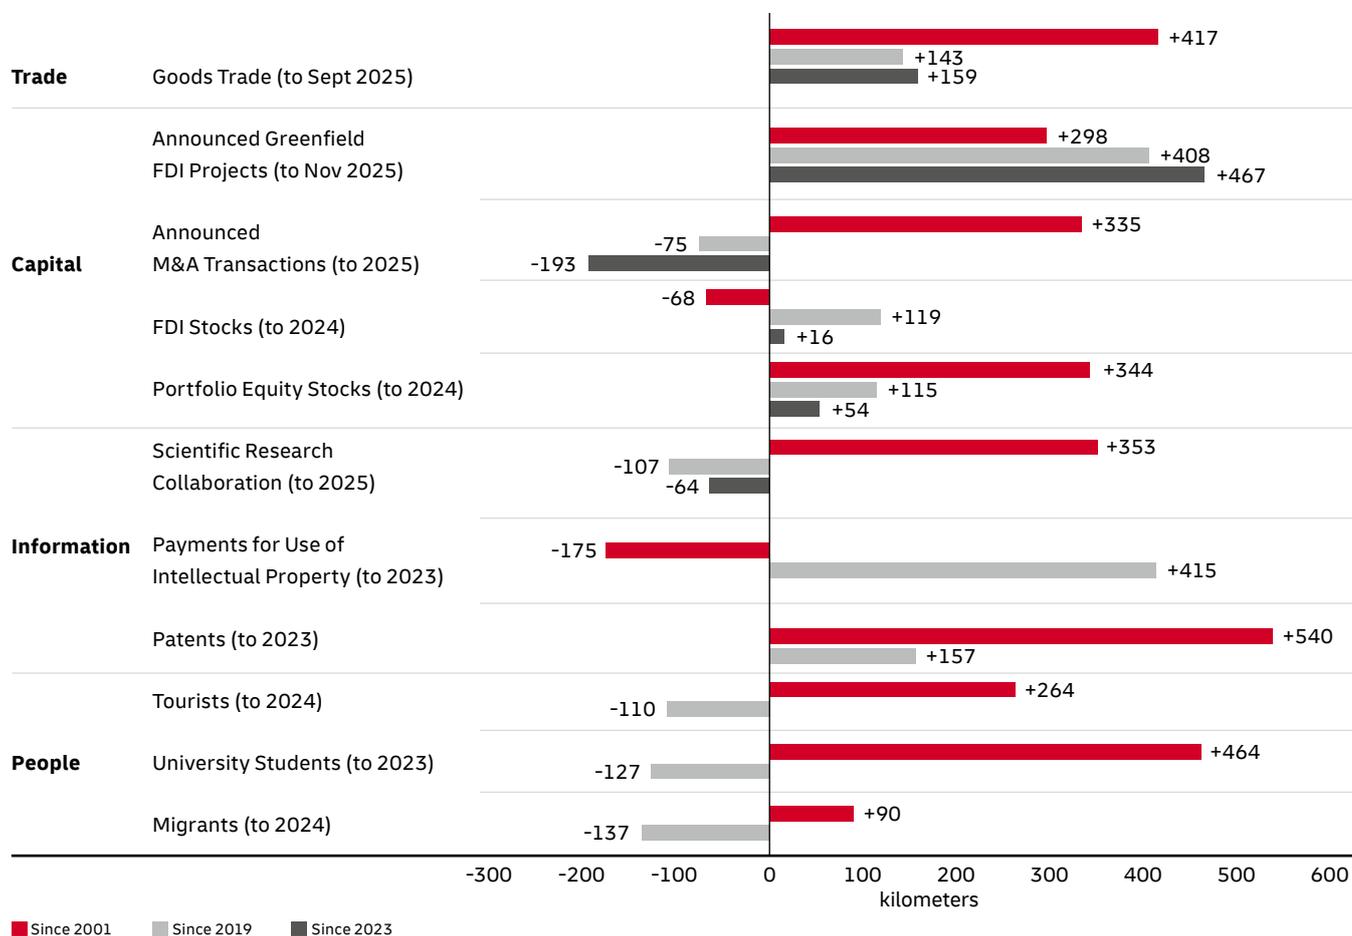

**Contrary to predictions of a shift from globalization to regionalization, the international flows measured on the DHL Global Connectedness Index took place over the longest distance on record in 2024, and the share taking place within regions was just slightly higher than the record low level set in 2023.** Data sources: Breadth data sources listed in Table A.3 in the Appendix, CEPII Gravity.

Why measure regionalization using both the share of flows within regions and the average distance over which flows take place? Because the percentage of flows happening within regions—the more widely used measure—can yield very different results depending on

how countries are classified into regions.<sup>2</sup> The average distance avoids subjective choices involved in defining regional groupings. Shorter average flow distances signal increasing regionalization; longer distances indicate decreasing regionalization.<sup>3</sup>

**FIGURE 5.2: CHANGE IN AVERAGE DISTANCE IN KILOMETERS (THROUGH 2025 OR MOST RECENT AVAILABLE YEAR)**

**People flows is the only category consistently occurring over shorter distances since 2019.**

Data sources: Breadth data sources listed in Table A.3 in the Appendix, CEPII Gravity.

Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

At the same time, current data reaffirm the longstanding pattern that international activity is highly regionalized.<sup>4</sup> Almost half of all flows measured on the DHL Global Connectedness Index took place inside major world regions in 2024. (For average distance and percent intra-regional trends for the four pillars of the DHL Global Connectedness Index—trade, capital, information, and people—refer to **Figure B.1** in the Appendix)

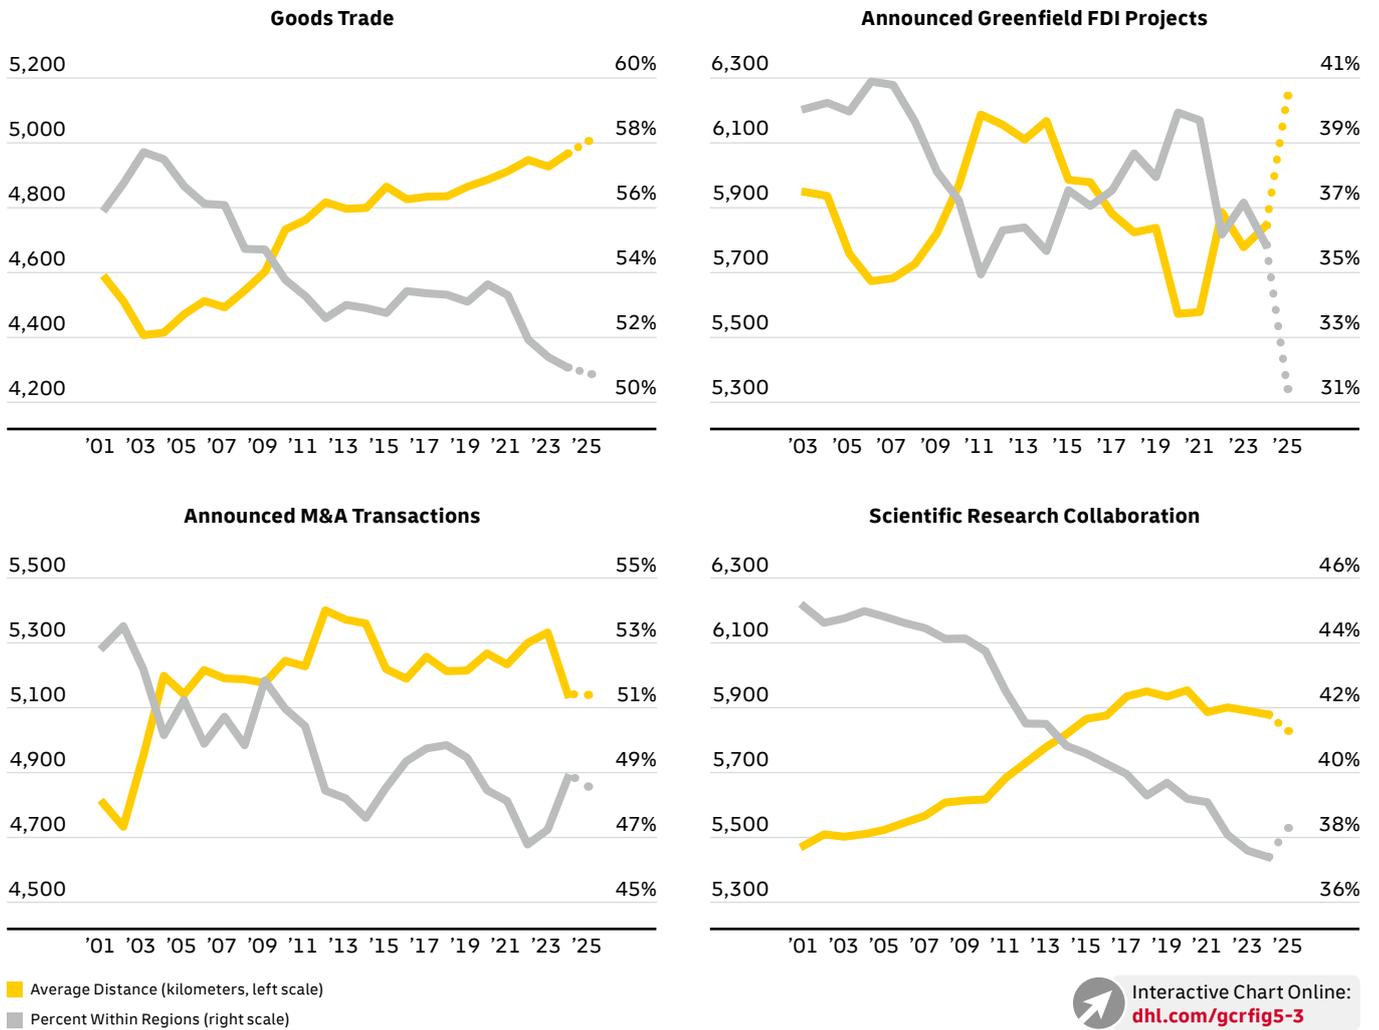

#### More granular data also undercuts narrative of rising regionalization

**Figure 5.2** summarizes average flow distance changes for specific types of international flows over three time periods: since 2001 (long-term shifts), since 2019 (changes relative to before the Covid-19 pandemic), and since 2023 (recent short-term shifts). Since 2001, all flows except FDI stocks

and payments for use of foreign intellectual property have shifted to longer distances. More recently, only M&A activity, scientific collaboration, and people flows (tourists, international education, and migration) show shifts to shorter distances. Because there are longer reporting lags for data on people flows (most recent data are from 2023–2024), these shifts to shorter distances may still reflect lingering effects of pandemic-era mobility restrictions.

Four of the flow types in **Figure 5.2** have 2025 data available: goods trade, announced greenfield FDI, announced M&A transactions and scientific research collaboration. **Figure 5.3** considers these specific flow types in terms of their average distance and regionalization trends (as in **Figure 5.1**). The results for goods trade and announced greenfield FDI are striking. In 2025, both of these flow types took place over

**FIGURE 5.3: AVERAGE DISTANCE AND REGIONALIZATION TRENDS FOR GOODS TRADE, GREENFIELD FDI, M&A, AND SCIENTIFIC RESEARCH COLLABORATION, 2001 – 2025**

**Goods trade and announced greenfield FDI traversed the longest average distances on record in 2025, and the share of these flows happening inside major world regions fell to new lows.**

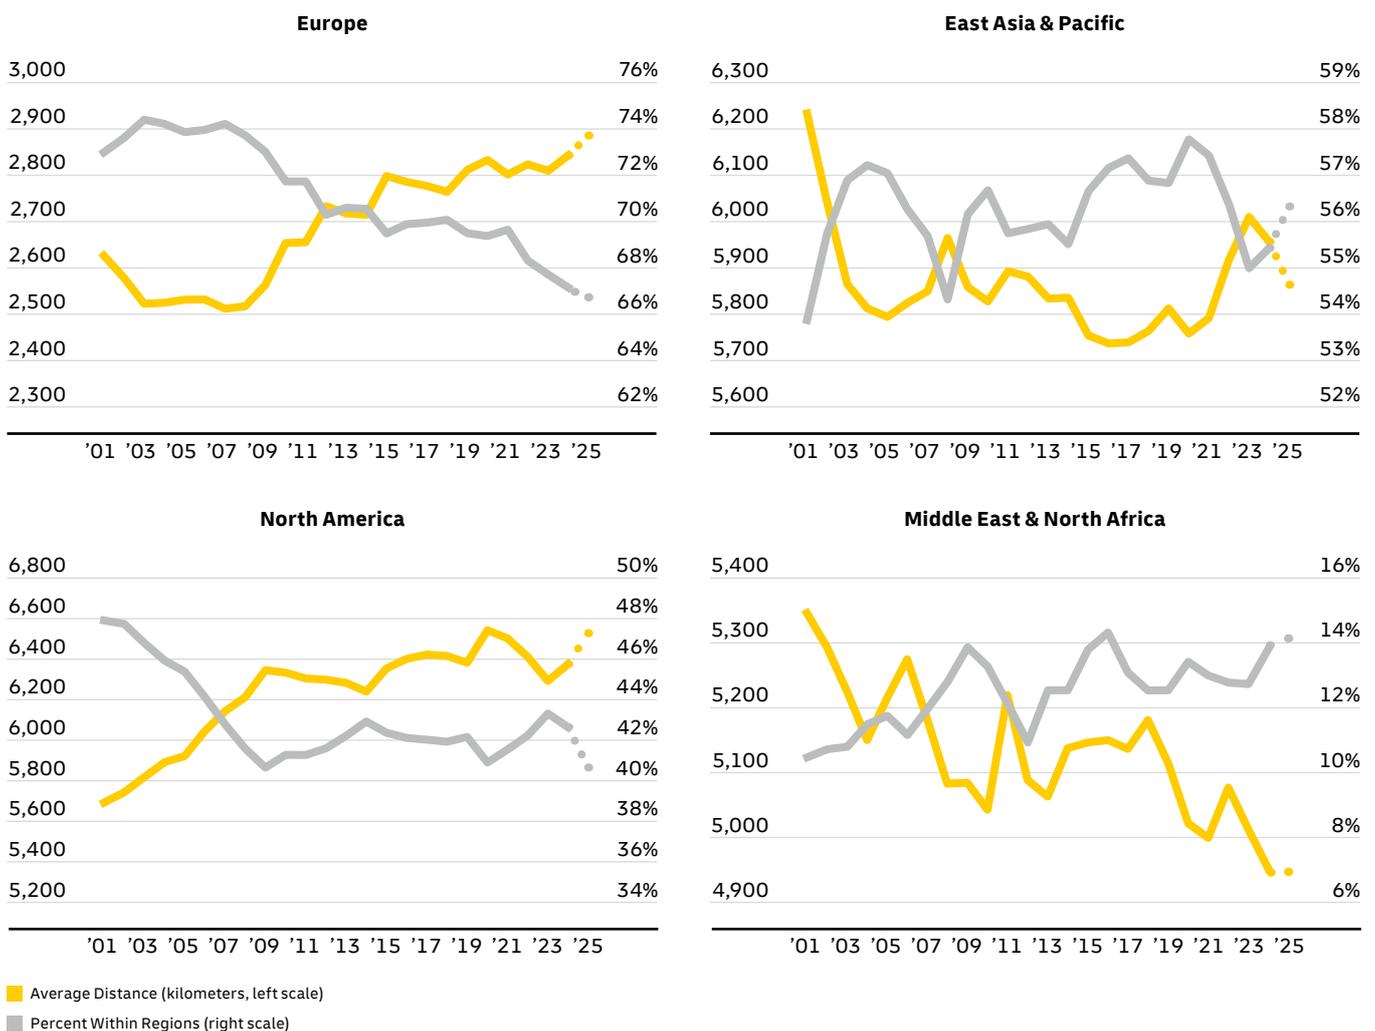

Data sources: IMF International Trade in Goods, UN Comtrade, Financial Times fDi Markets, LSEG SDC Platinum, Clarivate Web of Science, CEPII Gravity. Note: 2025 goods trade data cover January to September only; 2025 announced greenfield FDI data cover January to November only.

the longest average distances on record (yellow line), while the shares of these flows happening inside geographic regions (gray line) fell to new lows. For announced M&A transactions and scientific research collaboration, the data do not show a consistent pattern of rising or falling levels of regionalization.<sup>5</sup> Thus, these most recent results provide strong evidence that international activity has not—at least yet—become more regionalized.

**Emerging Market Growth and Business Across Longer Distances.** A key driver of international flows taking place across greater distances over recent decades is the growth of emerging economies, which has expanded opportunities for exchange between geographic regions. Back in 2001, Europe<sup>6</sup> and North America alone accounted for 65% of global exports and imports. Over the first nine months of 2025, those two regions' share of world trade was down to 51%, due mainly to East Asia and the Pacific's rise from 24% to 32% (powered, of course, by China's growth from a fairly modest role in global trade to the largest). As global economic activity spread out across a wider variety of locations, there were greater opportunities for long-distance exchange.<sup>7</sup>

## GOODS TRADE TRENDS BY REGION

**FIGURE 5.4: GOODS TRADE AVERAGE DISTANCE AND REGIONALIZATION TRENDS, BY REGION, 2001 – 2025**

Among the three largest trading regions, only East Asia & Pacific has a rising trend for regionalization since 2023.

Data sources: IMF Direction of Trade Statistics, UN Comtrade, CEPII Gravity database. Note: 2025 trade data cover first nine months of the year.

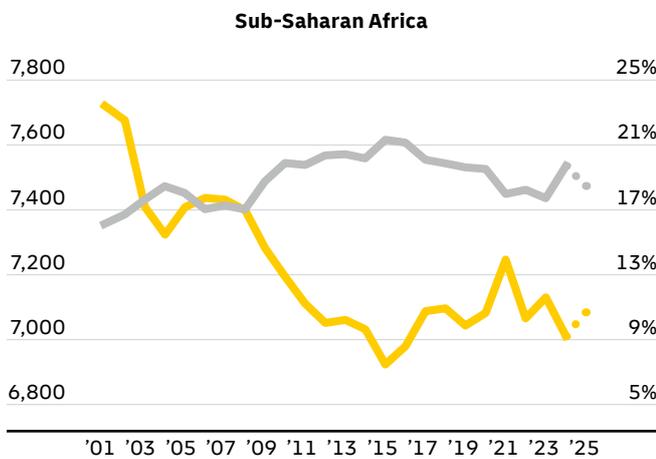

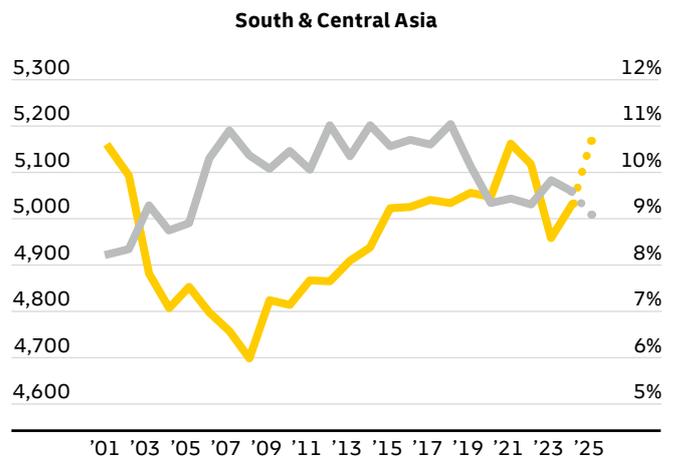

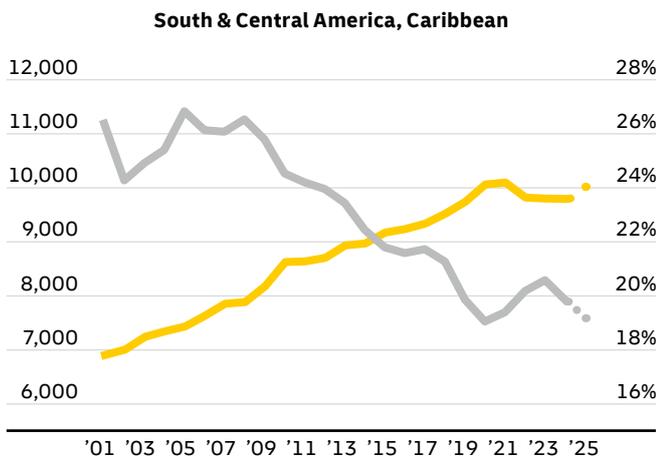

We have already seen that, globally, trade has become less regionalized through 2025, with goods moving over the longest average distances on record. From the standpoint of shifts in global supply chains, it is also striking that intermediate goods used to produce exports also traversed the longest average distance in 2024 (the most recent year with data available), as reported in Figure 3.7 on p. 33.

**Most regions mirror global trend**

The same general pattern also holds at the level of major world regions. **Figure 5.4** reports separate trends for each of the individual regions. The regions are presented in order of their shares of global trade. The first three regions drive the global trends, since they jointly account for 83% of total trade: Europe (36%), East Asia and the Pacific (32%), and North America (16%). The smaller regions' shares of world trade ranged from 2% (Sub-Saharan Africa) to 6% (Middle East and North Africa).

Between 2020 and 2023, North America's trade became more regionalized, but that pattern reversed in 2024 and 2025, bringing the intra-regional share of North America's trade back down to the lowest level observed in the data tracked here (since 2001). Europe's trade is already the most regionalized, but that region's trade has been gradually shifting toward lower levels of regionalization since 2008. East Asia and the Pacific's trade became more regionalized in 2024 and 2025, partially reversing a decline in regionalization during the preceding two years.

Trends across the four smaller regions are mixed. There has been a small recent increase in trade regionalization in the Middle East and North Africa. Across other regions, there are no clear and consistent rising or falling trends.

## IS A MAJOR INCREASE IN REGIONALIZATION ON THE HORIZON?

More than a decade ago, economists were already forecasting a shift toward more regional trade, and many companies reported plans to nearshore their supply chains.<sup>8</sup> More recently, resilience pressures, geopolitical tensions, regional trade agreements, emerging technologies, and environmental priorities have further intensified interest in producing closer to end markets. Although trade and other flows have not yet become more regionalized, several forces could drive greater regionalization moving forward.<sup>9</sup>

### Why regionalization could rise: Nearshoring push, supply chain reconfigurations, and proximity advantages

The strongest evidence supporting predictions of rising regionalization is the major push underway by companies and governments to pursue nearshoring and regionalization.<sup>10</sup> Mentions of nearshoring on corporate earnings calls increased substantially after trade disruptions due to the Covid-19 pandemic and the Ukraine war.<sup>11</sup>

Surveys continue to indicate strong interest in nearshoring. According to a 2024 survey of investment promotion agencies, 85% expected nearshoring to be an important trend through 2026.<sup>12</sup> A 2025 survey of supply chain leaders

showed roughly two-thirds of companies implementing regionalization strategies, with more than half actively nearshoring.<sup>13</sup> Major supply chain reconfigurations can take several years to execute, creating a lag between when companies announce nearshoring plans and when such shifts begin to affect trade patterns. One source predicts that supply chain reconfigurations will unfold gradually over 5–10 years.<sup>14</sup>

The longstanding appeal of doing business with regional partners is another potential driver of further regionalization. Geographic proximity can help reduce transportation costs, transit times, and cross-region interdependencies. Nearby countries also tend to have stronger non-geographic links, which can also boost the efficiency of regional business.<sup>15</sup> Countries in the same region are five times more likely than countries in different regions to be linked by a trade agreement and nearly three times more likely to share a common language.<sup>16</sup>

Nearshoring can also gain a boost from efforts to reduce the vulnerability of supply chains to geopolitical tensions. Neighboring countries tend to have friendlier relations than distant countries, as shown in the box titled, **The Link Between Nearshoring and Friendshoring.**

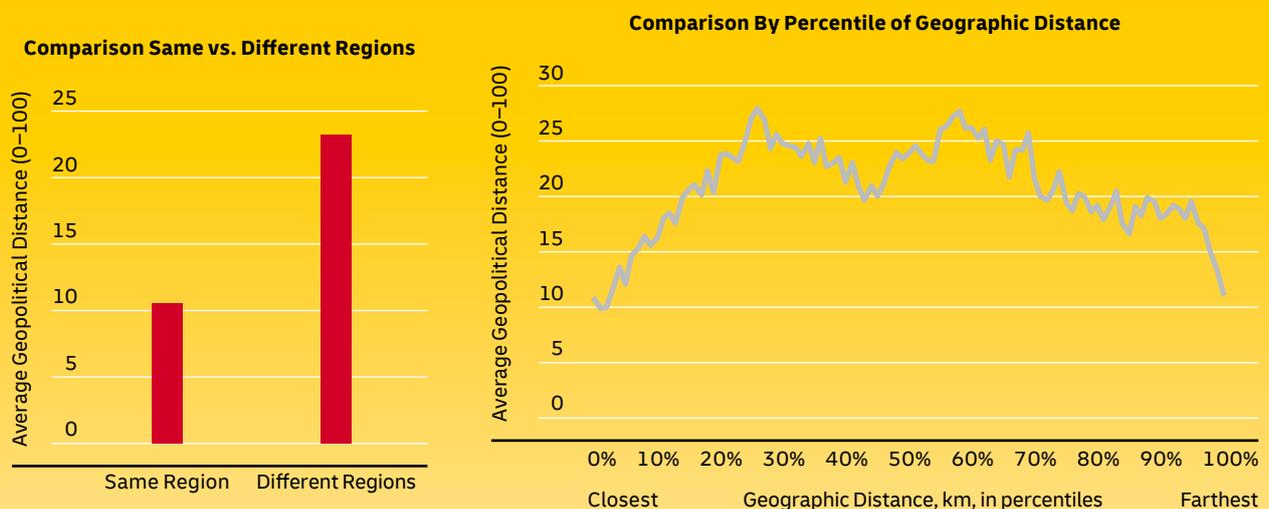

### Structural realities limit the case for greater regionalization

At the same time, there are several reasons to be skeptical about a major shift toward more regionalized trade patterns. First, trade and other international flows are already highly regionalized (see **How Far Do Global Flows Reach Today?** on p. 71). Roughly half of trade already takes place within regions, which is about three times more than one would expect in a hypothetical world where distance and cross-country differences had no dampening effects on trade.<sup>17</sup> Moreover, the intra-regional share of trade stood at 58% as recently as in 2003. A return to that level, or even two-thirds, would not represent a dramatic break from historical norms.

## THE LINK BETWEEN NEARSHORING AND FRIENDSHORING

There is a natural link between friendshoring (shifting business to more geopolitically aligned countries) and nearshoring (shifting to neighboring countries), because geographically close countries tend to share more similar geopolitical orientations. The average geopolitical distance (measured using UN General Assembly voting patterns) between countries in the same geographic region is less than half as large as the geopolitical distance between countries in different regions (see **Figure 5.5**, left panel). There is especially strong geopolitical alignment (low geopolitical distance), on average, between the closest countries (right panel).

**FIGURE 5.5 GEOGRAPHY AND GEOPOLITICAL DISTANCE**

**Countries located in the same geographic region tend to be much more closely aligned on geopolitical issues than countries in different regions**  
 Data sources: M. A. Bailey, A. Strezhnev & E. Voeten (2017); CEPII Gravity. Note: Geopolitical distance based on UN General Assembly voting between 2019 and 2023, rescaled 0-100.

**In summary**, predictions of a shift from global to regional business have not materialized—at least not yet. Many flows continue to stretch out over longer distances, with a declining share happening within regions. Goods trade and announced green-field investment crossed the longest average distances on record in 2025. Looking forward, strong business and government interest in building more regionalized supply chains could lead to some increases in regional business activity. However, international business is already highly regionalized and further regionalization can entail trade-offs, suggesting that a large shift from global to regional business is unlikely.

Second, long-distance trade continues to offer compelling advantages. It still contributes to specialization and scale economies, and provides access to inputs that may be scarce or even unavailable within a given region.<sup>18</sup> Long-distance trade can also contribute to resilience, broadening the variety of sources countries can access for essential goods.

Third, while many companies facing supply disruptions during the Covid-19 pandemic initially favored geographic reconfigurations of their supply chains to increase resilience, more ultimately chose to adopt alternative strategies, such as boosting inventory levels, dual-sourcing raw materials, and investing in digitization to improve supply chain visibility and flexibility.<sup>19</sup> A 2025 survey still found more firms adjusting inventories than pursuing regionalization or nearshoring.<sup>20</sup> Given the costs of relocating supply chains, many companies find it efficient to maintain current operations while considering different geographies for future expansion.

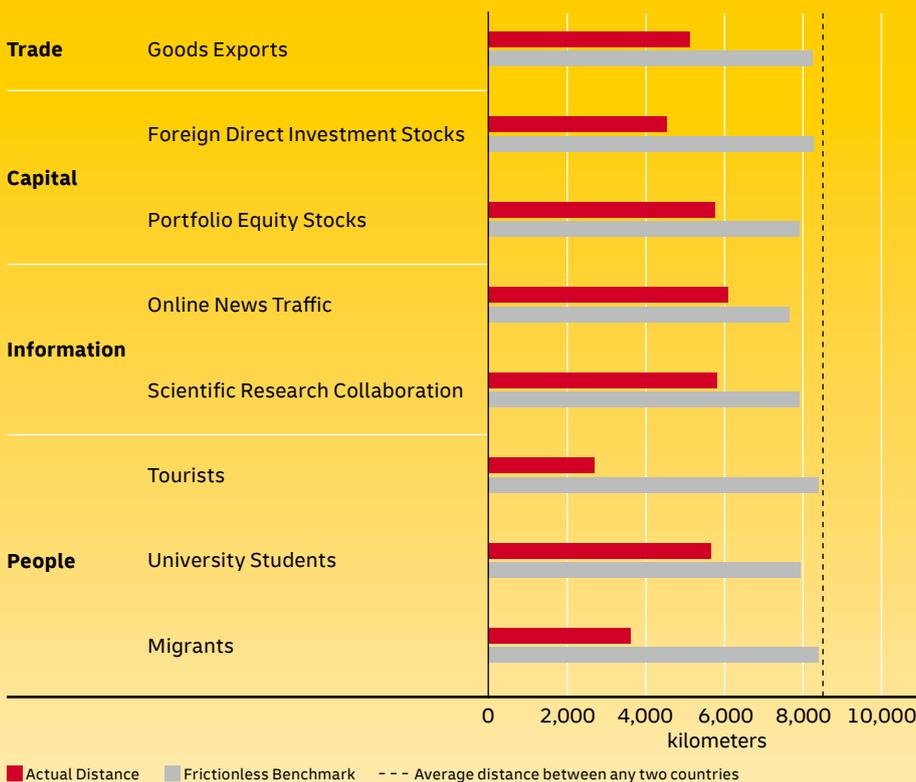

## HOW FAR DO GLOBAL FLOWS REACH TODAY?

Despite many advances in transportation and telecommunications in recent decades, international flows are still far larger between neighboring countries than between more distant ones. The average distance between pairs of countries around the world is about 8,500 km, but the flows covered on the breadth dimension of the DHL Global Connectedness Index averaged only 5,077 km in 2024.<sup>21</sup>

**Figure 5.6** compares the distance traversed by specific types of flows to how far those flows would be expected to travel if distance and cross-country differences had ceased to matter.<sup>22</sup> On average, this sample of flows went only about 60%

as far as they would in a “flat” world. Geographic distance, along with cultural, administrative/political, and economic differences have large effects on cross-border flows.<sup>23</sup> If we compare one pair of countries that is twice as close geographically as another otherwise similar pair of countries, statistical models indicate that this greater physical proximity alone boosts trade between the closer pair by as much as three times, and more than doubles the foreign direct investment (FDI) between them. Sharing a common language also has the effect of roughly doubling both trade and FDI between countries.<sup>24</sup>

**FIGURE 5.6: AVERAGE DISTANCE TRAVERSED BY INTERNATIONAL FLOWS, 2024**

The gray bars on this chart represent how far each flow might travel in a world where borders and distance were irrelevant. Under such conditions, we assume that each country's flows of a given type are proportional to benchmarks of the rest of the world's total activity. For example, each country consumes imports from every other country in proportion to every other country's share of world GDP.

# 6. WHICH COUNTRIES AND REGIONS ARE THE MOST GLOBALLY CONNECTED?

The first five sections of this report traced global and regional connectedness over time. In this section, we shift to countries' globalization levels in 2024, presenting each country's rankings on the DHL Global Connectedness Index and highlighting the top performers in each dimension of the index. While some countries are highly connected, others remain on the periphery.

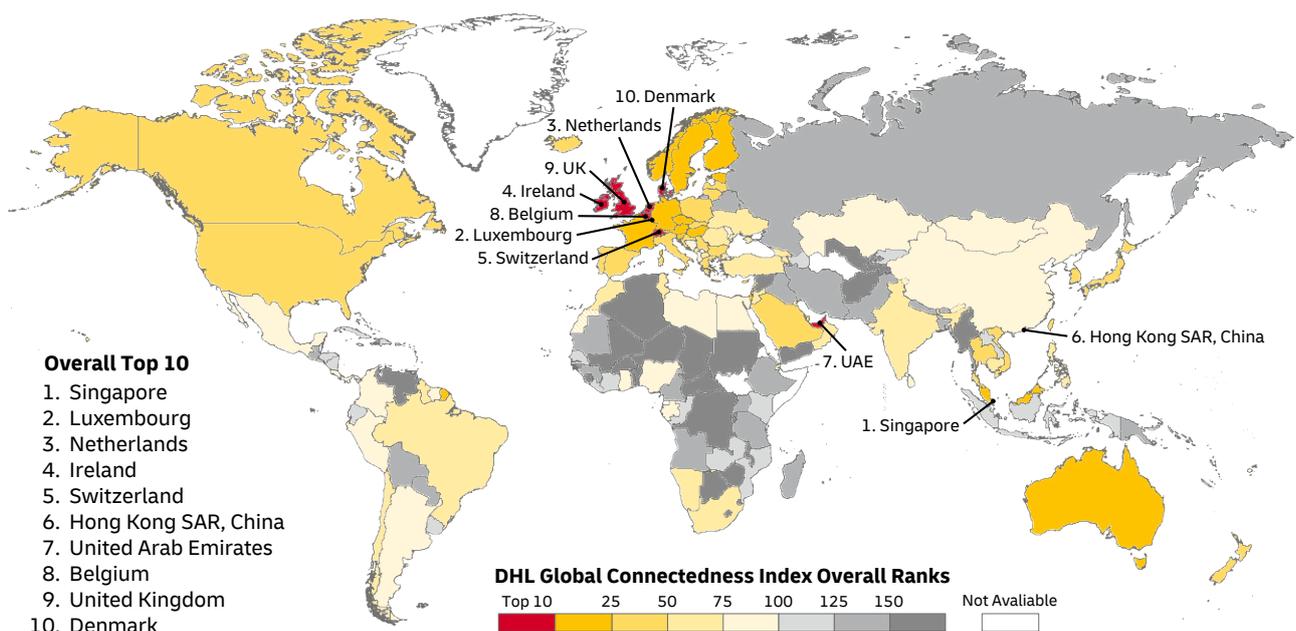

## THE WORLD'S MOST GLOBALLY CONNECTED COUNTRIES

While much of this report is focused on global trends, variation across countries is far greater than shifts at the global or regional level over time. Even in years when global connectedness declines, many countries become more connected—and vice versa.<sup>1</sup> This implies that country-level connectedness often matters more for policy and business decisions than broader global or regional patterns. For most companies and countries, the most relevant insights usually concern their own country, its immediate neighbors and especially large countries farther afield. In this section, we shift from looking at world trends toward a snapshot of each country in 2024.<sup>2</sup> **Figure 6.1** maps countries<sup>3</sup> colored by their ranks on the DHL Global Connectedness Index.

The DHL Global Connectedness Index ranks countries based on a weighted aggregation of their international trade, capital, information, and people flows (see p. 14). It assesses these flows along two dimensions: depth (size of international flows relative to domestic activity) and breadth (distribution of flows across origin/destination countries). **Table 6.1** reports the latest overall global connectedness ranking (based on data from 2024). For our index methodology, refer to **Section 8**.

**FIGURE 6.1: GLOBAL CONNECTEDNESS RANKS**

**The top ranked country on the DHL Global Connectedness Index was Singapore. Most highly ranked countries were relatively small and in Europe.**

Note: This map was generated using World Bank Official Boundaries. It does not reflect a position by DHL Group or NYU Stern on the legal status of any country or area or the delineation of any frontiers.

## DEPTH AND BREADTH DIMENSIONS OF GLOBAL CONNECTEDNESS

We measure each country's international flows along two dimensions: *depth* and *breadth*.

### Depth

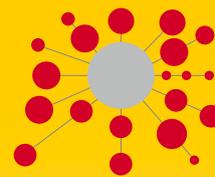

International Flows Relative to Domestic Activity

**Depth** measures international flows relative to a domestic benchmark. In some cases, this benchmark is a measure of total flows, both domestic and international, but it can also be a measure of overall size of a country's economy or population. For example, trade is compared to gross domestic product (GDP). This and other ratios help us evaluate how significant the respective international flow is.

### Breadth

Geographic Distribution of International Flows

**Breadth** is a measure of the geographic distribution of international flows. This means we evaluate to what extent flows are spread across partners. After all, in a truly globalized world, one would expect countries to trade with a wide variety of nations. Our methodology for this measure compares the distribution of each individual country's flows with the distribution of all countries' flows.<sup>4</sup>

### Connectedness in 2024: Who leads, who lags, and why

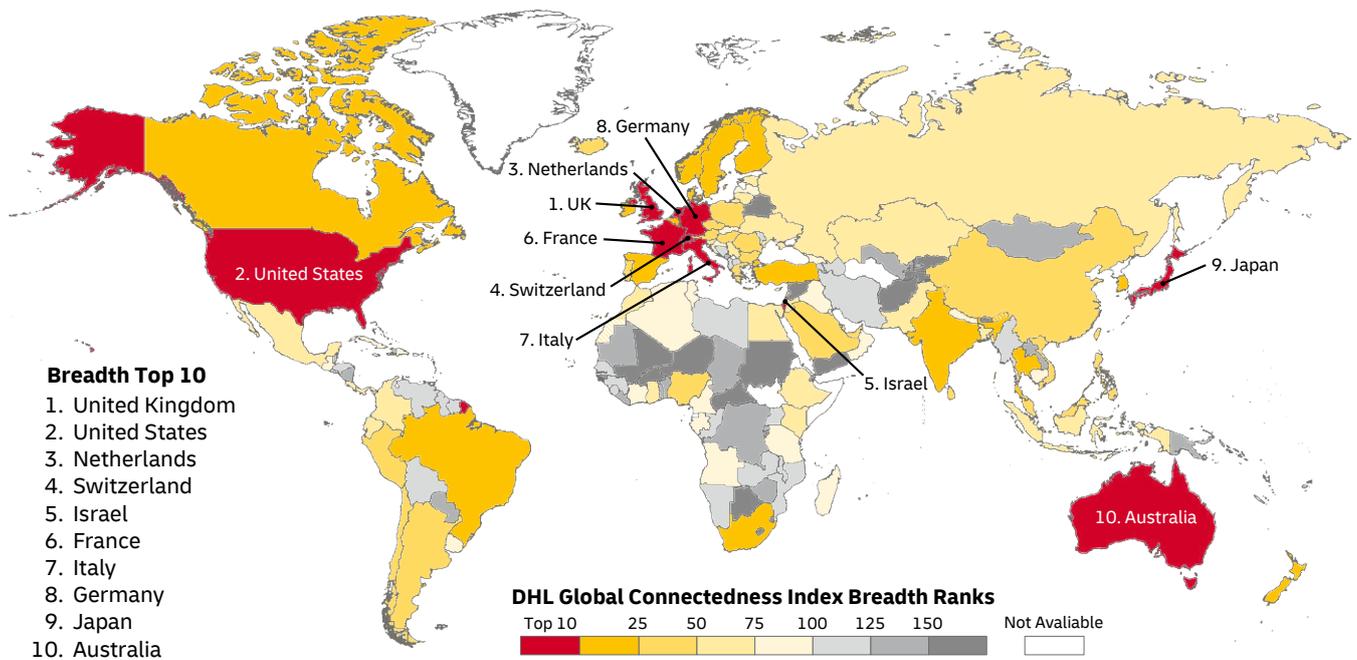

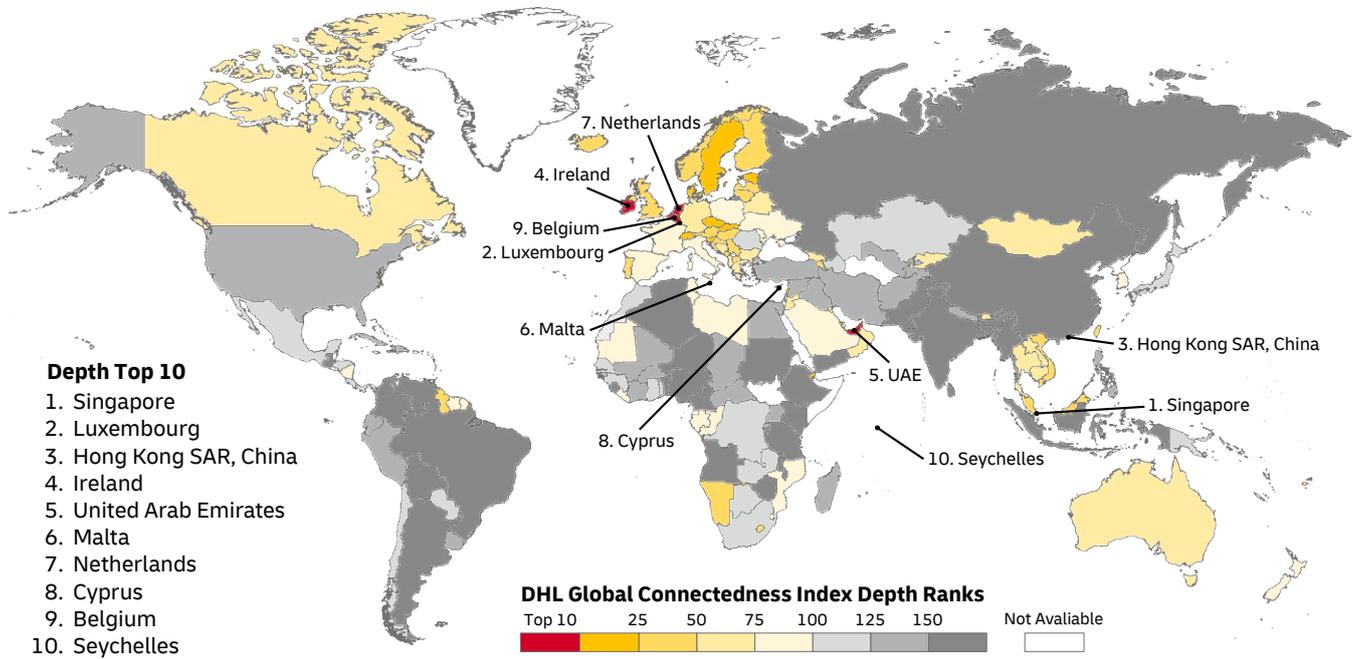

Singapore was the world's most globally connected country in 2024, followed by Luxembourg, the Netherlands, Ireland, Switzerland, Hong Kong SAR (China), the United Arab Emirates, Belgium, the United Kingdom, and Denmark. At the bottom of the rankings, in ascending order, were: Yemen, São Tomé and Príncipe, Niger, Sudan, Syrian Arab Republic, Central African Republic, Burundi, Botswana, Haiti, and Burkina Faso.

The country rankings on the separate depth and breadth dimensions of the index are summarized in **Figure 6.2**, and reported in Figures C.2 and C.3 in the Appendix. The economies with the largest international flows relative to domestic activity (depth leaders) in 2024 were: Singapore, Luxembourg, Hong Kong SAR (China), Ireland, the United

Arab Emirates, Malta, the Netherlands, Cyprus, Belgium, and Seychelles. Economies with higher depth scores tend to be wealthy and relatively small. Naturally, advanced economies with limited internal markets will have a larger share of their trade, investment, communications, and even people, outside of their own borders.

The countries with the most globally distributed flows (breadth leaders) were: the United Kingdom, the United States, the Netherlands, Switzerland, Israel, France, Italy, Germany, Japan, and Australia. The countries with the highest breadth scores have large economies (and high per-capita incomes). All of the top 10 countries on breadth rank among the world's 30 largest economies.

**FIGURE 6.2: GLOBAL CONNECTEDNESS DEPTH AND BREADTH RANKS**

**The depth dimension of the index is dominated by small economies, whereas the breadth leaders tend to be larger countries.**

Note: These maps were generated using World Bank Official Boundaries. They do not reflect a position by DHL Group or NYU Stern on the legal status of any country or area or the delineation of any frontiers.

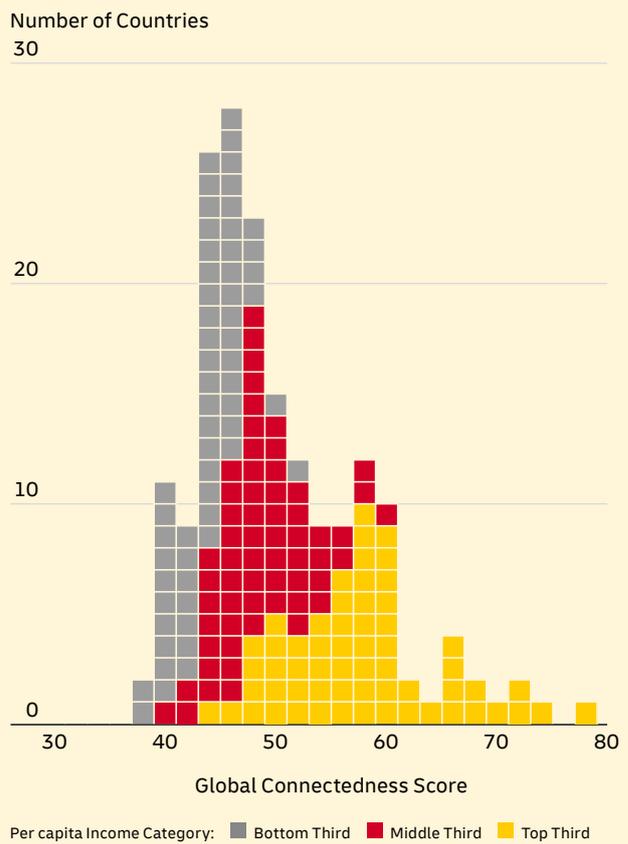

## HOW DOES INCOME LEVEL RELATE TO CONNECTEDNESS?

Wealthier countries are generally more connected to the rest of the world than poorer countries. **Figure 6.3** summarizes DHL Global Connectedness Index scores for countries in the top-third, middle-third, and bottom-third of the global (per-capita) income distribution.<sup>5</sup> All of the highest-scoring countries fall in the top income tier, and the lowest-scoring countries are in the bottom tier. The middle ranks, however, include countries from every income level.

Although income and connectedness are significantly correlated<sup>6</sup>, several countries achieve relatively high connectedness scores despite more modest incomes. Malaysia, Thailand, and Viet Nam stand out as the most globally connected countries in the middle-third of the income distribution. India, Cambodia, and Egypt are the most connected countries in the bottom-third of the income distribution.

The positive relationship between global connectedness and per-capita income levels appears to reflect a mutually-reinforcing relationship between connectedness and prosperity. Several studies have shown, for example, that trade and FDI can contribute to faster economic growth. At the same time, higher income levels can also boost connectedness, for example, by supporting infrastructure investment and boosting the share of the population that can afford to travel abroad.<sup>7</sup>

**FIGURE 6.3 GLOBAL CONNECTEDNESS SCORES BY INCOME**

## THE WORLD'S 10 LARGEST ECONOMIES

While the world's largest economies exert a powerful influence on worldwide patterns of activity, most are not among the most globalized countries. Countries that rank highly on the DHL Global Connectedness Index combine both large international flows relative to domestic activity (high depth) and globally distributed flows (high breadth). Large economies often score high on breadth but low on depth because of their large internal markets. The United States, for example, ranks 39<sup>th</sup> overall. Because of the wide reach of its international flows, it ranks second worldwide on breadth. But these international flows are small in relation to domestic activity, which is why it ranks only 131<sup>st</sup> out of 180 countries on depth. Similarly, China's 81<sup>st</sup> rank overall reflects a much higher rank on breadth (29<sup>th</sup>) than depth (177<sup>th</sup>).

DHL Global Connectedness Index rankings for the world's ten largest economies (ranked by GDP at market exchange rates in 2024) are shown to the right.

GDP	Rank	Country	Score	Change 2019 to 2024	
				Rank	Score
1.	39	 United States	57	-9	-1
2.	81	 China	49	-4	-1
3.	14	 Germany	61	0	-1
4.	46	 Japan	55	+2	+1
5.	58	 India	52	0	0
6.	9	 United Kingdom	66	-1	-1
7.	22	 France	59	-2	0
8.	28	 Italy	58	+5	+1
9.	26	 Canada	59	-4	0
10.	60	 Brazil	52	+4	+1

### Singapore: A half-century of deliberate globalization

Singapore was the top ranked country on overall global connectedness, as well as on the depth dimension of the index. Its 26<sup>th</sup> place ranking on breadth is also impressive, considering the country's small size. As noted already, smaller countries tend to have high depth but low breadth. As a city state with major port operations and a thriving financial sector, Singapore is uniquely positioned to excel in globalization. Well before the pursuit of "global city" status became fashionable, Singapore began enacting policies to leverage global connectedness as a cornerstone of its economic development strategy.<sup>8</sup> In 1972, less than seven years after Singapore's independence, Singapore's first foreign minister, S. Rajaratnam, gave a speech titled "Singapore as a Global City." The country went on to pursue a multi-pronged globalization strategy encompassing industry-specific policies, infrastructure development, and active promotion of inward foreign direct investment.

### Luxembourg: A multilingual financial hub at the heart of Europe

Luxembourg has reached second place status in 2024, also ranking second on depth and 36<sup>th</sup> on breadth. The Grand Duchy is located in the heart of Europe, the world's most connected region, and is particularly active in cross-border capital flows. It is also one of three capitals of the European

Union and home to many European institutions. Most Luxembourgers speak four languages and 51% of the country's inhabitants are foreign-born.<sup>9</sup>

### Netherlands: Openness and regional integration sustain global reach

The Netherlands earned its third-place rank on the index based on its combined strength across the depth and breadth dimensions (ranking seventh on depth and third on breadth). The Netherlands' unique combination of geography, regional integration with its neighbors, domestic market attractiveness, and long tradition of international openness have made it a consistent leader in global connectedness.<sup>10</sup>

### United Kingdom: A global-reach economy leading the world in breadth

The United Kingdom was the highest-ranked country in terms of breadth. It ranked ninth overall, but only 43<sup>rd</sup> on depth. The UK has a long history of global reach, having colonial ties to over 80 countries.<sup>11</sup> Despite leaving the European Union, it continues to have strong ties with its European neighbors, as well as with the United States, making it a natural top performer on breadth.

## CHANGES IN GLOBAL CONNECTEDNESS OVER TIME

### Five-year declines in breadth contrast with rising depth scores

Over the period from 2019 to 2024—the most recent five-year period covered in our full country-level analysis—85 countries saw their connectedness scores rise, while 95 posted declines. The average change in score over this period was  $-0.1$ .

This pattern of more countries posting score decreases than increases over the past five years was driven by the breadth dimension of the index. Between 2019 and 2024, 118 countries posted falling breadth scores while 62 countries showed increases. The average change in breadth scores was  $-0.3$ . As shown on **Figure 2.8** on p. 21, the breadth of international flows on a global basis (measured based on how closely each country's flows matches the distribution of all countries' flows) peaked in 2022 and declined in 2023 and 2024. The largest contributor to this decline was changes in goods trade patterns during the early stages of the Ukraine war.

By contrast, most countries posted rising depth scores over the past five years, indicating increases in international flows relative to domestic activity. Between 2019 and 2024, 102 countries posted rising depth scores, while 78 countries posted declines. The average change in depth scores was  $+0.2$ .

Looking over a longer time period, there is a more consistent pattern of increases in global connectedness. Across the full 23 years since 2001 covered by the index, 142 countries have increased their connectedness, while only 37 declined (the average score change was  $+1.9$ ). The majority of countries posted increases on both the depth and breadth dimensions of the index over this longer time period.

**TABLE 6.2: LARGEST INCREASES IN GLOBAL CONNECTEDNESS**

Since 2022	Score Change	Since 2019	Score Change	Since 2001	Score Change
 1. Timor-Leste	+2.6	 1. Namibia	+5.4	 1. United Arab Emirates	+13.0
 2. Namibia	+2.4	 2. Guyana	+4.2	 2. Namibia	+10.1
 3. Nigeria	+2.2	 3. Lao PDR	+4.0	 3. Lao PDR	+7.7
 4. Kyrgyzstan	+1.9	 4. Kyrgyzstan	+3.4	 4. Albania	+7.7
 5. DR of the Congo	+1.9	 5. Timor-Leste	+3.2	 5. Mozambique	+7.6
 6. Lao PDR	+1.8	 6. Bahrain	+2.7	 6. Singapore	+7.5
 7. Zambia	+1.8	 7. Malaysia	+2.6	 7. Slovenia	+7.0
 8. Gambia	+1.7	 8. Bhutan	+2.6	 8. Libya	+6.5
 9. Eswatini	+1.5	 9. Zimbabwe	+2.3	 9. Viet Nam	+6.4
 10. Kazakhstan	+1.3	 10. United Arab Emirates	+2.3	 10. Qatar	+6.3

#### Diverging trajectories: Trade-powered growth and crisis-related declines in connectedness

Tables 6.2 and 6.3 show the countries with the largest increases and decreases in connectedness scores over different time periods.

Between 2022 and 2024, Timor-Leste posted the biggest gain, followed by Namibia and Nigeria, each rising by more than two points since 2022. Over the five-year span between

2019 and 2024, the top increases were in Namibia, Guyana, and Lao People's Democratic Republic. Looking back to 2001, the largest long-run gains were in United Arab Emirates, Namibia, and Lao People's Democratic Republic.

Two countries, Namibia and Lao People's Democratic Republic, appear on all three lists, showing both long-run increases in connectedness as well as recent growth. Both countries' largest gains since 2019 were on the trade pillar of the index,

**TABLE 6.3: LARGEST DECREASES IN GLOBAL CONNECTEDNESS**

Since 2022	Score Change	Since 2019	Score Change	Since 2001	Score Change
 1. Lebanon	-5.8	 1. Russian Federation	-6.4	 1. Russian Federation	-4.9
 2. Cyprus	-4.6	 2. Cyprus	-5.1	 2. Yemen	-4.5
 3. Russian Federation	-3.2	 3. Luxembourg	-3.6	 3. Syrian Arab Republic	-3.8
 4. Hungary	-2.9	 4. Belarus	-3.4	 4. Iraq	-3.7
 5. Lithuania	-2.9	 5. Myanmar	-3.2	 5. Eswatini	-2.9
 6. Netherlands	-2.8	 6. Ghana	-2.9	 6. Angola	-2.6
 7. Estonia	-2.7	 7. Dominica	-2.8	 7. Venezuela	-2.4
 8. Belgium	-2.5	 8. São Tomé and Príncipe	-2.8	 8. Vanuatu	-2.2
 9. Bulgaria	-2.5	 9. Ireland	-2.7	 9. Congo	-2.2
 10. Cuba	-2.4	 10. Mozambique	-2.7	 10. Belarus	-2.2

with increases in both the depth and the breadth of their trade flows.

The countries with the largest decreases between 2022 and 2024 were Lebanon, Cyprus, and Russian Federation. Since 2019, the country with the largest decline was the Russian Federation, where there was a sharp drop in connectedness beginning in 2022 after the full-scale invasion of Ukraine and sanctions imposed in response.

Longer-term patterns underscore some of the key factors shaping countries' global connectedness trends, as depicted in **Figure 6.4**.<sup>12</sup> Peace and security are a key foundation without which international connections are severely impaired. Many of the long-term rises and declines align with the escalation or de-escalation of violent conflicts.

For example, the largest two-year decline ending in 2024 was in Lebanon, a country that has moved from crisis to crisis

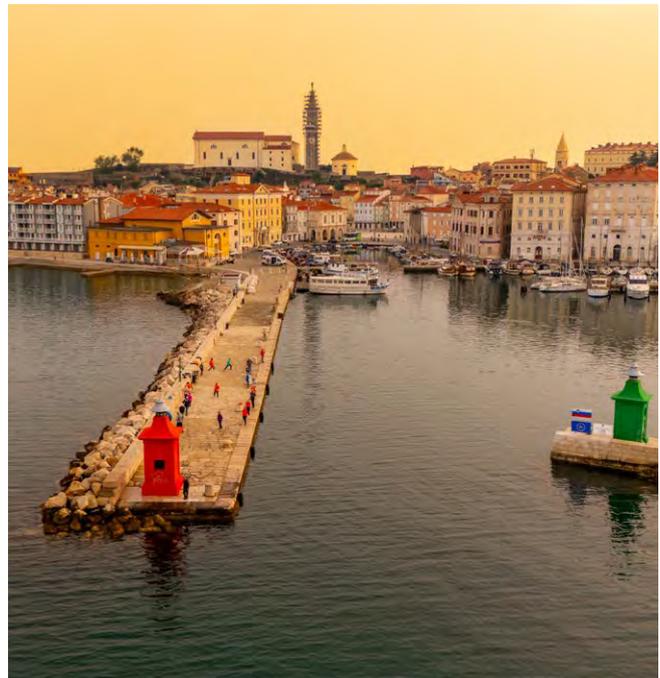

**FIGURE 6.4: KEY POLICY MEASURES FOR GLOBAL CONNECTEDNESS**

Peace and security and the domestic business environment form a foundation upon which international openness, regional integration, and public support can also boost global connectedness.

in recent years. Between 2019 and 2024, its GDP contracted by 39 percent as the country faced a currency collapse, the fallout from the massive Beirut port explosion, and then a conflict with neighboring Israel.<sup>13</sup>

**Foundations of rising connectedness: Security, attractiveness, openness, regional integration**

With basic security in place, countries can strengthen their global engagement by improving domestic business conditions and adopting policies that enhance openness to international flows. Several of the countries with the largest gains in connectedness pursued both approaches. The United Arab Emirates—posting the largest increase since 2001—substantially increased its global connectedness through a multifaceted development strategy spanning areas such as international shipping, air connections, tourism, and finance, supported by the development of free zones and extensive use of foreign labor and capital.

Regional integration is also a powerful enabler of global connectedness, and several of the countries with the largest gains in connectedness have boosted their regional ties. Slovenia and Cyprus, for example, joined the EU in 2004. Singapore participates in ASEAN, as well as both the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) and the Regional Comprehensive Economic Partnership (RCEP). Namibia, Mozambique and Libya are all participants in the African Continental Free Trade Area (AfCFTA).<sup>14</sup>

## GLOBALIZATION AND MAJOR REGIONS

Levels of global connectedness vary widely across major world regions. This matters especially because nearly half of all international activity occurs within regions rather than between them, as shown in Figure 5.1 (p. 63).

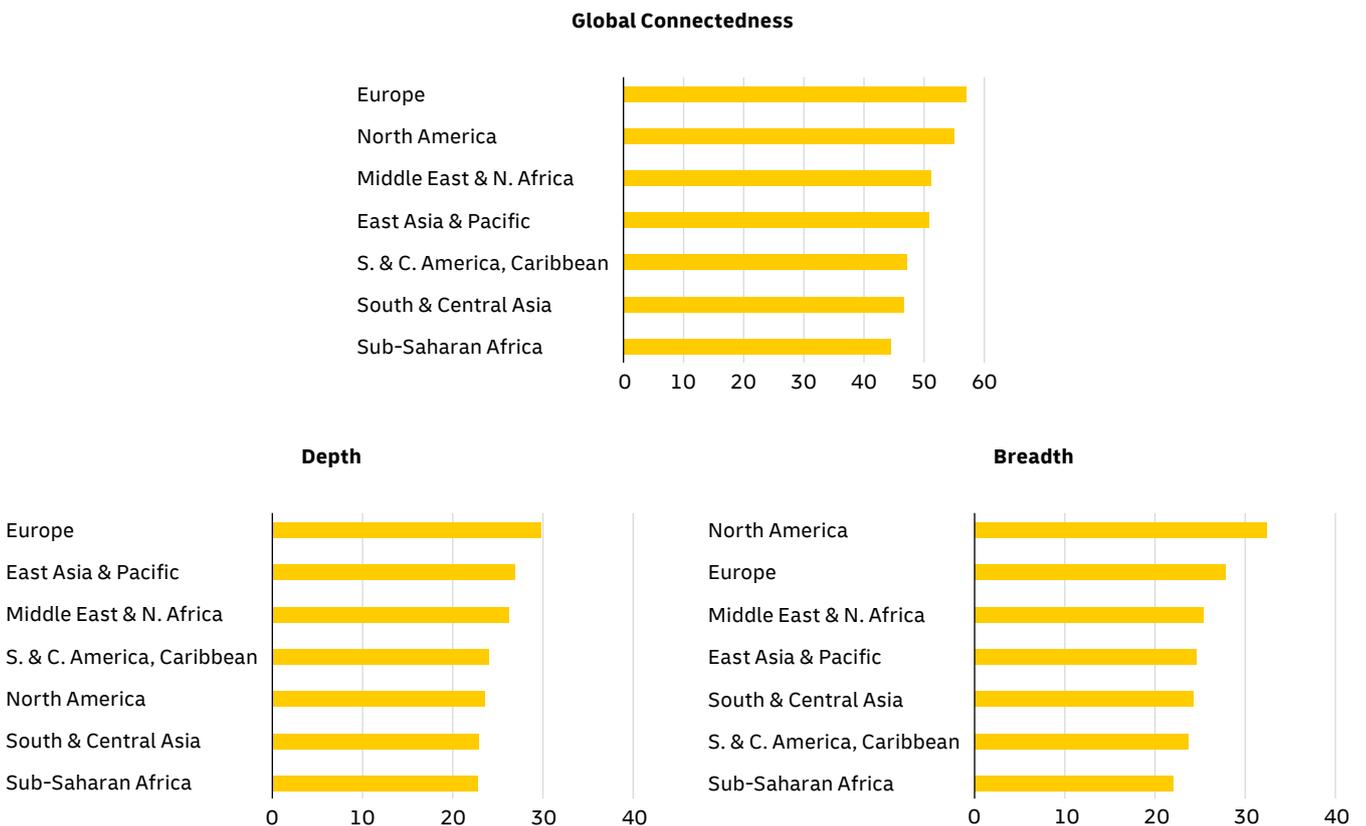

### Global connectedness by region: Wealth, proximity, and integration drive outcomes

Figure 6.5 shows average global connectedness, depth, and breadth scores for countries in each region (using the region classification reported in Table A.4 in the Appendix).<sup>15</sup> Countries in Europe had the highest average levels, followed by

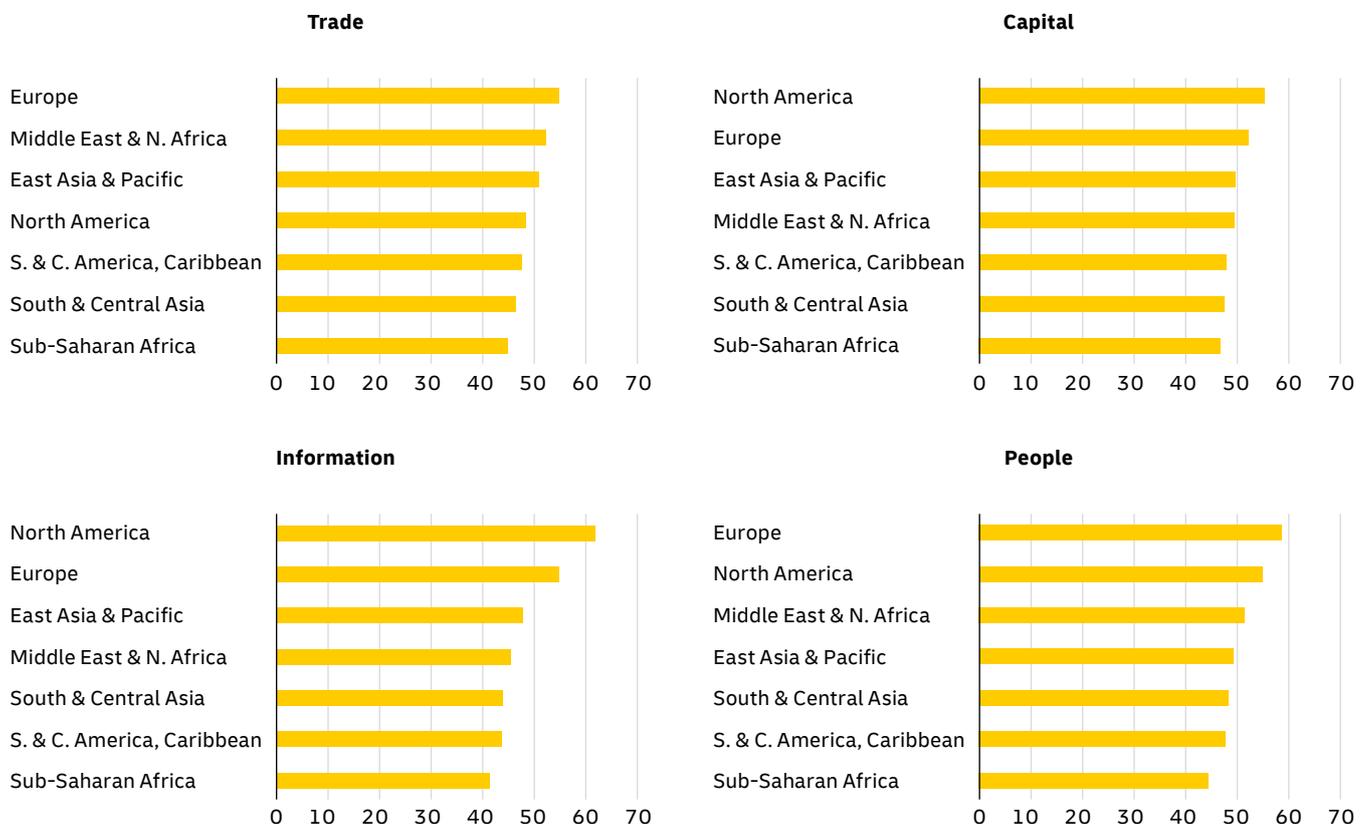

North America. The Middle East and North Africa and East Asia and Pacific ranked third and fourth. All of these regions lie above the world average. South and Central America and the Caribbean, South and Central Asia, and Sub-Saharan Africa, all fall below the world average.

Consistent with patterns described in the previous section, wealthier regions show higher levels of global connectedness than poorer ones. Countries in the four most connected regions average four times the GDP per capita of countries in the three least connected regions.

**FIGURE 6.5: AVERAGE OVERALL GLOBAL CONNECTEDNESS, DEPTH, AND BREADTH SCORES BY REGION, 2024**

Countries in Europe average the highest levels of overall global connectedness, followed by North America and Middle East and North Africa.

**FIGURE 6.6: AVERAGE TRADE, CAPITAL, INFORMATION, AND PEOPLE SCORES BY REGION, 2024**

Europe is the top-ranked region on trade and people flows, while North America leads on capital and information flows.

Europe's standing as the world's most globally connected region reflects both its structural characteristics (many wealthy countries in close proximity) as well as decades of policy initiatives aimed at promoting integration via the European Union (EU) and predecessors such as the European Economic Community (EEC). Europe's strength across the four pillars of the DHL Global Connectedness Index is supported by the core principles of the EU, which are closely connected with the pillars of the index. Three pillars (trade, capital, and people) are addressed directly by the EU's "four

freedoms"—the free movement of goods, capital, services, and people.<sup>16</sup> The remaining pillar, information, is addressed in part by the EU's Copenhagen Criteria for accession to the Union, based on which "the EU makes press freedom one of the criteria for accession."<sup>17</sup>

North America ranks second in overall connectedness, due primarily to the breadth of its international flows. The region ranks first on breadth but only fifth on depth. The high breadth and low depth reflect the fact that North America consists of

three of the world's largest economies. Based on 2024 GDP in current U.S. dollars, the U.S. is the world's largest economy, Canada is the ninth largest, and Mexico the 13<sup>th</sup>.<sup>18</sup>

The Middle East and North Africa region contains a diverse set of economies, many of which stand out on multiple dimensions. The wealthy Gulf states are well-connected to the world through trade, investment, immigration, and tourism. North African countries, meanwhile, are relatively well connected to Europe, due to their geographic proximity.

**Figure 6.6** shows average scores for the trade, capital, information, and people pillars of the index by region. Europe leads on trade and people flows, while North America leads on capital and information flows. The Middle East and North Africa ranks second on trade, reflecting both the importance of the oil trade and the close ties many of these countries have to Europe. Europe ranks second on capital and information, whereas North America ranks second on people. Sub-Saharan Africa ranks last on all four pillars.

**In summary**, Singapore ranks as the world's most globally connected country, followed by Luxembourg and the Netherlands, based on 2024 data. Singapore leads on the depth dimension of the index, whereas the United Kingdom leads on breadth. Since 2019, Namibia posted the largest gain in connectedness, while the Russian Federation had the largest decline. Europe is the world's most globally connected region, followed by North America and the Middle East and North Africa.

# 7. CONCLUSION: WHY DEGLOBALIZATION IS OVERSTATED

The core finding of this report is that global flows of trade, capital, information, and people remain robust—even as the ‘deglobalization’ narrative grows louder. We conclude by examining why the story and the data diverge. This section provides a bigger-picture view of the deglobalization narrative, highlights biases that can distort perceptions about globalization, and spotlights often-overlooked reasons for the resilience of global flows.

“Most discourse on deglobalization is driven by developments in areas other than actual flows between countries.”

This report has shown that global flows remain stable relative to domestic activity, traverse the longest distances on record, and have only seen limited realignments so far along geopolitical lines. These findings contrast sharply with prominent narratives about globalization going into reverse. Why do we see such a large gap between the globalization headlines and the globalization data? Understanding the reasons for this divergence is not only analytically valuable—it has become essential for maintaining an accurate and balanced view of the state of globalization.

**DEBATING DEGLOBALIZATION**

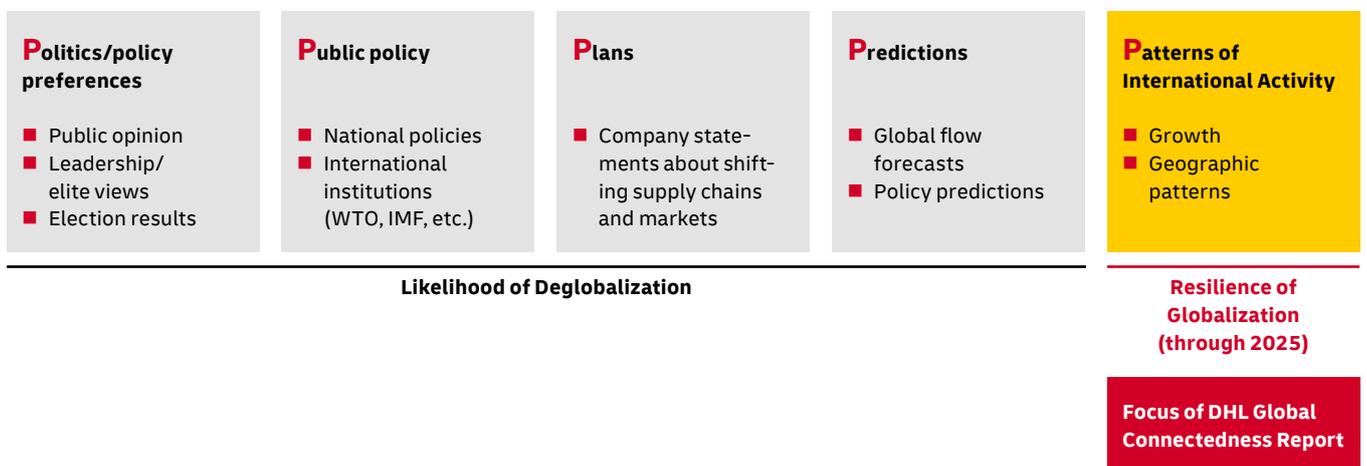

Deglobalization has become a prominent topic in public discourse. The most important reason why this theme has surged even as global flows remain robust is that most of the discourse on deglobalization is driven by developments in areas other than actual flows between countries (the four

P’s depicted in gray boxes in **Figure 7.1**). Political shifts signal changes in public and elite opinion, influencing policy choices. Policy shifts, in turn, affect corporate plans and feed into predictions about the future. But changes in politics, policy, plans, and predictions speak only to the likelihood of deglobalization; they are not evidence that global integration has actually declined.<sup>1</sup>

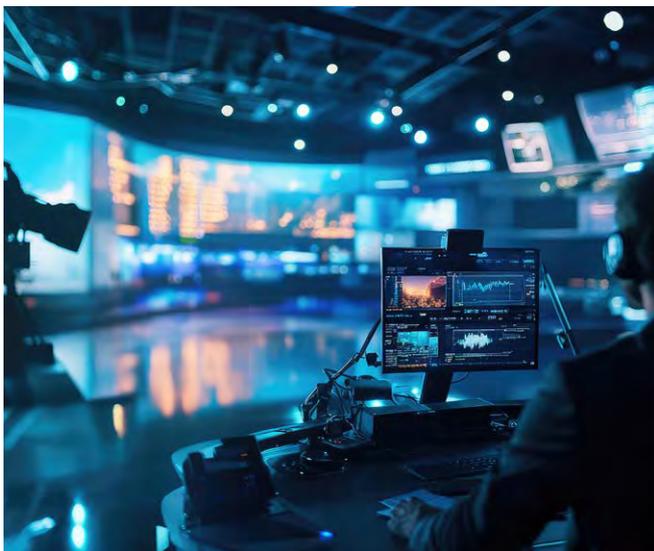

A closer look at the four gray categories in Figure 7.1 helps understand why factors that so clearly raise the specter of deglobalization have not translated—at least so far—into substantive reductions in globalization levels:

In the case of **public opinion**, recent polling indicates that people are more supportive of international flows than the headlines suggest. In 2025, 81% of Americans saw trade as an opportunity rather than a threat—a 30-year high in Gallup data.<sup>2</sup> Globally, Ipsos reports that “perceptions of

**FIGURE 7.1: FIVE STRANDS OF THE DEGLOBALIZATION NARRATIVE (FIVE P’S)**

The disconnect between the deglobalization narrative and the resilience of actual flows across borders reflects how most deglobalization discourse focuses on politics, policy, plans, and predictions, rather than actual patterns of international activity. Source: Based on Table 1.1 of Steven A. Altman, Caroline R. Bastian, and Davis Fattedad, “Challenging the deglobalization narrative: Global flows have remained resilient through successive shocks,” *Journal of International Business Policy*, Volume 7, 2024.

globalization have improved in many markets around the world over the past decade.”<sup>3</sup> Across 43 countries surveyed in 2025, 64% of respondents viewed globalization as good for their nation. These trends caution against interpreting political outcomes as evidence of broad public backlash.<sup>4</sup>

In **public policy**, as discussed in **Section 3**, the escalation of U.S. tariffs to the highest levels since the 1930s has not triggered a global surge in trade barriers. Many countries have instead accelerated new trade agreements to secure alternative market access. The use of industrial policy tools is rising, but its impact is concentrated in strategic sectors like advanced technologies and critical minerals—not across the full spectrum of global commerce.<sup>5</sup>

In terms of corporate **plans**: while surveys (cited in **Section 5**) show strong interest in nearshoring, similar intentions have appeared for over a decade without making trade more regional.<sup>6</sup> Announced plans often overstate actual shifts.<sup>7</sup> In 2025, many U.S. firms pledged new domestic investments, yet the U.S. still led global outbound green-field FDI—and companies from other countries, particularly China, announced bold international expansion plans.<sup>8</sup>

**Predictions** are essential to guide decision-making, but they carry major caveats in volatile periods. As discussed in **Section 3**, trade growth in 2025 far outperformed forecasts issued early in the year, underscoring the need to take forecast caveats seriously rather than focusing only on headline projections. (The April 2025 WTO forecast, which predicted a small decline in global trade volumes, mentioned the word “uncertainty” 78 times.)<sup>9</sup> Historical analysis (such as the research cited in **Section 4** indicating elevated risk to global flows during periods of hegemonic decline or transition) is also valuable, but historians often emphasize using the past to understand patterns and risks when making decisions—not as a basis for forecasting events.<sup>10</sup>

### BEWARE OF BIASES

Shifts in politics, policy, plans, and predictions do signal an elevated risk of deglobalization, but we have seen that the news in these areas is not all negative. There are also important positive signals, such as new trade agreements signed and bold corporate expansion targets. Several common errors and biases can make deglobalization drivers appear stronger than they really are—and must be avoided to maintain a balanced view of the evolving international business landscape.

**Big country generalization:** As we saw in **Section 2**, the U.S., China, and Russia exhibit notable shifts—and in some cases declines—in international engagement. But when analyzing globalization, a disproportionate focus on the biggest economies or military superpowers can distort the picture. Their large domestic markets make them inherently less dependent on global flows, so their overall contribution to these flows is smaller than their shares of global output or innovation. The world’s 10 largest economies make up two thirds of the world’s GDP, but less than half of all trade. Moreover, the central roles that global superpowers play in geopolitical competition create unique incentives for these countries to recalibrate cross-border ties—incentives that the rest of the world does not share.

**Strategic industry generalization:** Developments in a narrow set of strategic sectors—such as semiconductors, critical minerals, biotech, and AI—should not be mistaken for the direction of globalization overall. Multiple countries have designated a small set of industries as strategic to national security and economic competitiveness, but they represent a limited share of global trade. Only about 20% of U.S. imports fall into advanced technology categories often deemed strategic, according to one estimate.<sup>11</sup> Most cross-border business activity remains outside the scope of these targeted policy interventions.

**Globaloney:** Many overestimate how globalized the world truly is—a misconception DHL Global Connectedness Index co-creator Pankaj Ghemawat calls ‘globaloney.’<sup>12</sup> This leads every setback for open markets to be seen as evidence of globalization’s collapse. In reality, the world is only about one-quarter of the way toward fully borderless integration. Because cross-border business has always been shaped by policy, geography, culture, and other frictions, recently imposed constraints—while meaningful—don’t imply as big a break with the past as they would if we really lived in a world where national borders had long ago become irrelevant.

**Motivated reasoning:** As Ghemawat also points out, people often interpret small shifts in global activity through the lens of what they hope or fear. Supporters of globalization see modest trade realignments along geopolitical lines as warnings of severe economic risk if blocs fully decouple. Critics seize on isolated reshoring moves as proof that globalization can be rolled back and national self-reliance restored. Both sides overread limited signals, distorting the broader picture.

**Negativity bias:** People naturally give more weight to bad news than good, so threats to globalization attract far more attention than positive developments.<sup>13</sup> This bias amplifies focus on U.S. tariff hikes while downplaying new trade agreements elsewhere, and it makes recently implemented barriers seem more significant than the decades of liberalization that still underpin resilient global business.

## REASONS FOR RESILIENCE

Finally, while threats to globalization demand serious attention, a balanced view also requires us to consider reasons—often overlooked—why global flows may continue to show resilience.<sup>14</sup>

### 1. Globalization gains still matter

Despite heightened focus on the risks of interdependence, most economists still view globalization as a net positive.<sup>15</sup> There is strong evidence that trade and FDI both support economic growth, and that deglobalization could entail steep costs.<sup>16</sup> Financial markets plunged after President Trump’s “Liberation Day” tariff announcement in April 2025, and they rebounded after he put these tariffs on pause. Weighing such benefits and costs, many leaders strive to mitigate vulnerabilities while preserving gains from globalization. When European Commission President Ursula Von der Leyen introduced the term “de-risking,” she was careful to clarify that, “most of our trade in goods and services remains mutually beneficial and ‘un-risky.’”<sup>17</sup> Similar thinking underpinned decisions by most countries not to match U.S. tariff hikes in 2025.

*“International flows tend to be far more stable than the politics surrounding them.”*

## 2. Adaptability drives resilience

Multinationals—the ‘visible hand of globalization’—continue to adapt quickly when cross-border frictions rise.<sup>18</sup> Firms shift from trade to local production or partnerships when trade barriers increase, and digital flows surged when the pandemic halted travel. After navigating COVID-19 and the Ukraine war, companies have become even more agile. As IMF Managing Director Kristalina Georgieva noted, stronger-than-expected 2025 trade and GDP growth reflected private-sector adaptability—from import frontloading to stockbuilding and supply-chain strengthening.<sup>19</sup>

## 3. De-risking does not equal de-globalization

De-risking is far less disruptive to globalization than often assumed—and can even expand global flows. Most international business already occurs among countries with friendly or neutral ties; in 2025, only a small share of trade and investment—12% of goods trade and 3–5% of greenfield FDI and M&A—took place between rival blocs.<sup>20</sup> For many Western-focused firms, de-risking means shifting some production from China to economies like Viet Nam and Mexico, which often rely more on imported inputs and attract new multinational and supplier investment.<sup>21</sup>

## 4. Tech could still boost global flows

Technology has historically expanded globalization by lowering the cost and friction associated with distance. While some argue automation and 3D printing could dampen trade, early 2025 saw a surge in semiconductor and AI-infrastructure equipment shipments.<sup>22</sup> The WTO projects AI could lift global trade in goods and services by 34–37% by 2040.<sup>23</sup> Advances in machine translation are also reducing communication barriers, supporting smoother multinational operations and potentially boosting international travel.

## 5. Multipolar growth expands opportunities

While geopolitical rivalry creates real risks, an increasingly multipolar world can also strengthen globalization. When economic activity spreads across more countries, opportunities for cross-border business multiply—as seen in the 2000–10 trade surge driven by growth in China and other emerging markets.<sup>24</sup> Long-term forecasts point to another broadening from 2025 to 2060, with India and other South and Southeast Asian economies gaining global GDP share as China holds steady and major advanced economies decline.<sup>25</sup>

**In short: Risks to globalization must be taken seriously, but so should the resilience of international flows.**

**We must clearly distinguish between risks to globalization and the actual development of international flows. While politics, policy, plans, and predictions all provide useful inputs for assessing the probability of deglobalization, patterns of actual international activity are what show whether globalization is in fact advancing or receding—and international flows tend to be far more stable than the politics surrounding them.**

**We are living in a period of great turbulence in the international environment, but it remains far from certain that we are heading toward a less globally connected future. So far, companies and countries are managing the challenges and opportunities of a complex and highly interconnected world rather than retreating to within national borders. There is an elevated risk of deglobalization, but the world—at least through 2025—is still as connected as it has ever been.**

# 8. INDEX METHODOLOGY AND DATA SOURCES

This section explains how the DHL Global Connectedness Index was constructed, describes the rationale for key methodological decisions, and lists the data sources used to calculate the index. It also highlights revisions to the methodology since the last edition.

The DHL Global Connectedness Report aims to provide a comprehensive and timely account of globalization—at both the global level and at the level of individual countries and regions. This edition includes a complete update of the DHL Global Connectedness Index, based on an analysis of more than 9 million data points on country-to-country flows. This section begins by elaborating the conceptual framework of the index. It then details the data collection, treatment, and aggregation phases of the analysis, both for the country-level rankings and the world trends. It closes with a discussion of changes to the methodology since the prior edition.

## CONCEPTS

The DHL Global Connectedness Index is a multidimensional measure of globalization. Since globalization can mean different things to different people, we use the term *global connectedness* to refer more specifically to the measurement of actual interactions across international borders.<sup>1</sup> Even after narrowing the scope, global connectedness implies many types of connections, which makes it an ideal application for a composite indicator, also known as an index. The starting point for the DHL Global Connectedness Index is the following definition:

**Global Connectedness refers to the depth and breadth of a country’s integration with the rest of the world, as manifested by its participation in international flows of trade, capital, information, and people.**

The DHL Global Connectedness Index captures both the depth and breadth of international flows:

*Depth* refers to the size of international flows as compared to a relevant measure of the size of all interactions of that type, both international and domestic. It reflects how important or pervasive interactions across international borders are in the context of business or life.

*Breadth* measures the distribution of flows around the world. Specifically, it measures how closely each country's distribution of international flows across its partner countries matches the global distribution of partners for those flows.<sup>2</sup> The breadth of a country's goods exports, for example, is a comparison between the distribution of its exports across destination countries versus the rest of the world's distribution of goods imports.

The above definition of global connectedness also identifies four specific categories of flows that are covered as the four pillars of the index. These are: trade, capital, information, and people. While the selection of these categories was subjective, they broadly encompass aspects of international connectedness that have substantial relevance for business people, policymakers, and ordinary citizens concerned with the impact of globalization on their life opportunities.<sup>3</sup> The measures, or components, used in this edition of the index appear in **Table 8.1**.

## DATA COLLECTION AND SOURCES

The DHL Global Connectedness Index is built primarily from internationally comparable data from multi-country sources, with additional data drawn from national statistics (see **Table 8.2** and additional detail on data sources in Appendix A). As in every edition of this report, the data used to compute the index have been completely updated—both to extend the results to include the most recent data and to incorporate revised source data for prior years. As a result, trend analysis should be done comparing results over time within a single edition of the index, not comparing results between different editions.

Depth measures are compiled, to the extent possible, using single data sources that report on every country covered in the index. This helps to ensure that they are comparable between countries. Where possible, the world depth is

\* Additional sources are listed in Appendix A – Indicator not included in breadth index

calculated using published world values, rather than by aggregating country-level data.

Breadth measures are calculated using reporting country data on interactions with all partners. Because these datasets have more limited availability, and quality of data is a concern, we often employ multiple sources for each flow. Quality and continuity of the data for each reporter are favored over using a single source. In cases where adequate data are not available from a reporting country but sufficient coverage<sup>5</sup> can be achieved by using flows in the opposite direction as

reported by partners (“mirror data”), these data are used instead.

While we have made every effort to produce a complete time series for each indicator and country from 2001 to 2024, most data for 2025 remain unreliable as of the time of publication, and thus, 2025 world trends results should be considered a forecast. The data for 2024, particularly for breadth measures, also remain subject to major revisions. In addition, we use some datasets that are not available in the earlier years. For example, the greenfield foreign direct investment

indicators are not available in 2001 or 2002, and online news traffic is only available for 2022 through 2025. These indicators are repeated in earlier years.

### DATA TREATMENT: COUNTRY RANKINGS

At the country level, depth measures are calculated by dividing the total flows of a given country to (or from) all countries in the world by a benchmark, such as gross domestic product (GDP) or population. Where available, we use benchmarks used commonly in the literature, such as exports and imports as a share of GDP and tourist arrivals per capita. Where there is no widely accepted measure, we typically use GDP for measures of trade and capital flows and population for information and people flows.

Breadth captures whether a country's international flows are spread out globally or more narrowly focused. It is quantified using a Finger-Kreinin Index<sup>6</sup>, a measure of similarity between two distributions. For the country rankings, the comparison is between each country's distribution of flows in one direction and the world distribution of those flows in the opposite direction. For example, the exports of a given country are compared with the world distribution of imports. Because a country cannot export to itself, the global distribution is adjusted to exclude the focal country. The Finger-Kreinin Index is defined as follows:

$$FK_i = \sum_{j=1}^n \min \left( \frac{x_{i,j}}{x_i}, \frac{m_j}{m - m_i} \right)$$

Where  $i$  is the focal country and  $j$  represents each individual partner country,  $x$  is the flow of exports, and  $m$  is the flow of imports. However, the same equation is used for import breadth (with  $x$  as imports and  $m$  as exports), as well as for every other flow.

For both depth and breadth, missing data pose a significant challenge. Rather than reducing the index to only include countries for which a complete dataset is available, we use a variety of machine learning models to fill in missing data. Additionally, for volatile capital flows (announced greenfield FDI, mergers and acquisitions, and foreign direct investment flows), the flow values are averaged with a loess-smoothed curve of their overall trend. This reduces the volatility at the country level and keeps unusual spikes from having an overwhelming effect on the country rankings.

Before the aggregation step, these individual indicators must be placed on a comparable scale. This is performed using z-score normalization. This means that for each indicator, we measure the mean and standard deviation of all countries in all years. The results are then rescaled such that the mean is 0 and the standard deviation is 1 to yield a score. In order to reduce the influence of extreme outliers, scores less than -2.5 or greater than 2.5 are recoded to -2.5 and 2.5, respectively.

### DATA TREATMENT: WORLD TRENDS

There are slight differences in how both depth and breadth are assessed for world trends as compared to country-level analysis. For world trends, both depth and breadth are set

to compare the world as it is to a hypothetical fully globalized world, as conceived in the international economics literature. In such a world, every interaction would have equal likelihood of taking place with every possible partner. For example, buyers would be equally likely to purchase goods from any seller, regardless of whether the seller is located in the same country, in a neighboring country, or in a distant part of the world. Although this type of world could never exist (imagine, for example, crossing an ocean to buy groceries), it is a useful comparison for understanding how far we are from a fully globalized “frictionless” world, where borders and cross-country distance and differences pose no constraints on interactions.

**Table 8.3** shows the flows and benchmarks used for world trends. The world depth measures are calculated, where possible, to approximate the international share of each flow. Where that is not possible, the average depth of the other flows in the same pillar is used as a proxy for the flow’s depth level, while the variation of the flow is used to determine the variation over time.

The resulting figures are then divided by a hypothetical frictionless level calculated based on the benchmark. This frictionless level is based on the idea that if each partner has the

same probability of being chosen, the percent international will be the same as the percentage of each partner that is in another country. Thus, for example, if 18% of the world’s population is in India, we would expect that a randomly selected person would have an 18% chance of being in India. In a world where every person has an equal probability of interacting with any other person, there is an 18% chance of each interaction happening with someone in India. Taking a weighted mean of these shares yields a hypothetical depth level for a fully globalized world.<sup>7</sup> This is equivalent to the sum of squares of each country’s share of the world total (in our example, the world’s population):

$$h = \sum_{i=1}^n \left( \frac{y_i}{y} \right)^2$$

Where  $h$  is the frictionless hypothetical level,  $y$  is the world total (e.g., world population), and  $y_i$  is the amount in country  $i$  (e.g., India’s population). The final depth measure is simply the measured depth divided by the frictionless hypothetical level.<sup>8</sup>

The breadth world trends are calculated using the components listed in Table 8.3. Breadth world trends are reported using a variety of measures. In **Sections 4 and 5**, we report the average distance (kilometers), percent intra-regional, and average geopolitical distance (based on UN voting patterns). In Appendix B, we also report those measures at the pillar level, along with two Finger-Kreinin breadth measures and two diversification measures (1-HHI and share of flows with countries other than the top 5 partners).

As in the case of the country data, missing data are imputed where necessary using machine learning. For 2025 data, where few complete datasets are available, we have developed forecasts for many indicators based on preliminary data and published forecasts at the component level.

### AGGREGATION

The overall index is built up from its constituent components via three steps, as illustrated in **Figure 8.1**. First, the individual components are aggregated into pillars, resulting in the computation of distinct pillars of the same type for depth and breadth. The weights are shown in **Table 8.4**. Then, overall depth and breadth scores are computed, with trade and capital pillars each receiving 35% of the total weight, and information and people receiving 15%. These pillar weights reflect our sense of the relative priorities business and economics audiences place on aspects to consider when measuring globalization. For the country ranking, the

pillar scores are once again rescaled, this time such that the mean is 50 and the largest outlier (depth or breadth) is either 0 (if negative) or 100 (if positive). This results in a score between 0 and 100 with 50 as the mean, which is an intuitive approach for our readers.

In step 3, we take the geometric mean of these two dimensions of the analysis to produce the DHL Global Connectedness Index.<sup>9</sup> The geometric mean slightly favors countries that have balanced scores over those with higher levels for one dimension and lower levels for the other. This fits with the intuition that a truly global pattern of activity requires

**FIGURE 8.1: THE INDEX IS AGGREGATED IN THREE STEPS: FIRST AT THE PILLAR LEVEL, THEN AT THE DIMENSION LEVEL, AND FINALLY AT THE INDEX LEVEL**

**Aggregation of the index proceeds in three steps: first the components are aggregated to the pillar level; then the pillars are aggregated to the combined depth and breadth level; and finally, the depth and breadth scores are aggregated to overall global connectedness.**

high scores on both dimensions. A country with small international flows—even if they are distributed broadly around the world—is not very globalized. Nor is a country with large international flows that are narrowly distributed.

#### CHANGES FROM THE 2024 EDITION

We aim to strike a balance between the long-term continuity of the index and enhancements to modernize the methodology and improve on prior work. The core methodology used to calculate this edition of the DHL Global Connectedness Index remains largely the same as in previous editions, and nearly identical to the 2024 edition. Since the first edition of the index, released in 2011, the framework of measuring depth and breadth of trade, capital, information, and people flows has remained constant, and most of the individual indicators have remained constant as well.

In this edition, the methodology has remained largely the same as in prior editions. The most notable difference is the phasing out of the International Internet Bandwidth per Internet User depth measure. Although the Internet remains one of the most important ways that information crosses borders in the present era, this measure has become increasingly flawed over time. The International Telecommunication Union (ITU) has not collected data on this measure for developed countries since 2017. While other sources are available, the data were not comparable and there appear to be significant challenges in measuring it accurately. Furthermore, as data centers become a larger part of the way information is served on the Internet, countries that have more of those data centers have increased their international bandwidth without Internet users in those countries producing or consuming more information from abroad.<sup>10</sup>

## NOTES SECTION 1

### EXECUTIVE SUMMARY

- 1 This comparison holds based on both January to November actual global trade volume growth (as reported by CPB World Trade Monitor) and based on projected full-year growth using the data sources listed in note 3 below.
- 2 WTO, "World trade volume remained flat in Q3 of 2025 while its dollar value hit record high," January 28, 2026.
- 3 Composite forecasts drawn from IMF World Economic Outlook, Economist Intelligence Unit, Oxford Economics, and S&P Global Market Intelligence, following the methodology employed in Steven A. Altman and Caroline R. Bastian, DHL Trade Atlas 2025, DHL Group, 2025. Downgrade reflects shift from forecast compiled in January 2025 (before U.S. tariff increases) to forecast updated January 2026.
- 4 U.S. trade shares based on goods trade data from January to September of 2025. For data sources, refer to Appendix A.
- 5 For definitions of these international business investment indicators, refer to Table A.1 in the Appendix. For discussion on the use of alternative FDI measures, refer to the box titled "Complementary Measures of Foreign Direct Investment" on p. 36.
- 6 People flow data are reported with longer lags than other flows, with the most recent global international student mobility data as of 2023. More recent data for major higher education destinations (U.S., Canada, and UK) show recent declines in new international student enrollments, as reported in Section 3.
- 7 See, for example, Michael Blanga-Gubbay and Stela Rubínová, "Is the Global Economy Fragmenting?" WTO Staff Working Paper ERSD-2023-10, October 11, 2024; Gita Gopinath, Pierre-Olivier Gourinchas, Andrea F. Presbitero, Petia Topalova, "Changing Global Linkages: A New Cold War?" April 5, 2024; UNC-TAD Global Trade Update, December 2025.
- 8 Classification of which countries are deemed "close allies" is according to Mark Williams, Julian Evans-Pritchard, and Rhydian Walsh, "The Shape of the Fractured World in 2025," Capital Economics, January 17, 2025. Further details are available in the original publication, Julian Evans-Pritchard and Mark Williams, "China Economics Focus: Mapping Decoupling," Capital Economics, September 17, 2021.
- 9 All measures of 2025 trade patterns reported in this Executive Summary are based on data from January to September, and all 2025 announced greenfield FDI patterns are based on data from January to November.
- 10 Average geopolitical distance for goods trade increased modestly in 2024 and then declined in 2025 (January–September) back to roughly the same level as in 2023. Geopolitical distance calculated according to 2019–23 UN General Assembly votes (rescaled 0–100), based on the Ideal Point Distance measure reported by Bailey, M. A., Strezhnev, A., & Voeten, E. 2017. Estimating Dynamic State Preferences from United Nations Voting Data. *The Journal of Conflict Resolution*, 61(2): 430–56.
- 11 This measure is based on the Finger-Kreinin measure of "export similarity." To measure change over time, we compare the composition of a country's flows across partner countries to the composition of the same country's flows in the previous year. To reverse this measure from indicating similarity to indicating difference (change), we subtract the result from 1 and rescale the result between 0 and 100 for more convenient presentation. At the global level, we use flow-weighted averages of the country-level measures. For background on the Finger-Kreinin measure, refer to J. M. Finger and M. E. Kreinin, "A Measure of 'Export Similarity' and Its Possible Uses," *The Economic Journal*, Vol. 89, No. 356, December 1979.
- 12 Measured based on China's share of foreign value added from goods-producing sectors absorbed in the U.S. economy, using data from Asian Development Bank Multiregional Input-Output Tables.
- 13 Steven A. Altman, Caroline R. Bastian, and Davis Fattedad, "Challenging the deglobalization narrative: Global flows have remained resilient through successive shocks," *Journal of International Business Policy*, Volume 7, 2024.
- 14 Pankaj Ghemawat, *The New Global Road Map: Enduring Strategies for Turbulent Times*, Harvard Business Review Press, 2018.
- 15 Steven A. Altman, "15 Reasons to Be Optimistic about Globalization," *Harvard Business Review*, December 22, 2025.

## NOTES SECTION 2

### GLOBALIZATION SNAPSHOT

- 1 To define this range, we draw on the trade literature, in which the global distribution of economic output has been used to establish an estimate of trade intensity (the exports-to-GDP ratio) in a frictionless world. In a hypothetical frictionless world, each country would buy goods and services in proportion to countries' shares of world GDP. As a result, each country's imports-to-GDP ratio would be equal to one minus its share of world GDP, and the global ratio of exports or imports to world GDP would equal one minus the sum of all countries' squared shares of world GDP. See James A. Anderson, "The Gravity Model," *Annual Review of Economics* 3, no. 1, 2011 and Arvind Subramanian and Martin Kessler, "The Hyperglobalization of Trade and Its Future," PIIIE Working Paper 13-6, Peterson Institute for International Economics, 2013. We apply the same logic to all of the types of international flows on the depth dimension of the DHL Global Connectedness Index where depth is measured as the international share of a relevant indicator of total activity, using the denominators of the various depth ratios analogously to how GDP is used for trade. For example, for immigrants as a share of world population, population substitutes for GDP. For depth ratios that are not calculated by dividing international flows by a closely parallel indicator of total activity (e.g. charges for use of intellectual property as a percentage of GDP), we rescale these "quasi-depth" ratios to match the pillar-level averages of the "real" depth ratios, and we apply the growth rates of the quasi-depth ratios to establish trends for these indicators. For trade, to avoid counting goods that cross more than one border in multi-country supply chains more than once, we use data on trade in value added terms, drawing on the Asian Development Bank's Multi-regional Input Output Tables (ADB MRIO), which are available up to 2024. In 2025, for a rough approximation, we assume that trade intensity in value added terms changes at the same rate as trade intensity using standard (gross) trade values. These have, historically, been highly correlated.
- 2 We adopt the term "depth" here for what economic research typically refers to as "intensity." The terms are intended to have equivalent meanings.
- 3 Additional data sources for the points summarized here are cited in Appendix A.
- 4 Measured in value added terms to avoid multiple-counting of value crossing more than one border. For additional explanation, refer to Section 3.
- 5 The most recent available global international student mobility data are as of 2023. More recent data for major higher education destinations (U.S., Canada, and UK) show recent declines in new international student enrollments, as reported in Section 3.
- 6 Exports (% of GDP) is reported in Figure 2.3 in gross rather than value added terms due to lack of historical data on trade in value added. As a result, this export intensity series is elevated due to multiple-counting of goods crossing borders more than once in multi-country supply chains. Figure 2.3 data sources: Exports 1820–1938: Federico-Tena World Trade Historical Database: Openness; exports 1939–1949: Mariko J. Klasing and Petros Milionis, "Quantifying the Evolution of World Trade, 1870–1949," *Journal of International Economics* 92.1, 2014; exports 1950–1959: Penn World Tables 9.0; exports 1960–2014: World Bank World Development Indicators; exports 2015–2025 IMF World Economic Outlook, World Bank World Development Indicators, Economist Intelligence Unit, Oxford Economics Global Data, S&P Global Market Intelligence; Foreign Direct Investment (FDI) 1913–1985: UNCTAD World Investment Report 1994; FDI 1990–2024: UNCTAD World Investment Report 2025; Migrants 1870–1938: Laurence Chandy and Brina Seidel, "Is globalization's second wave about to break?" Brookings, October 4, 2016; migrants 1960–2024: UN DESA International Migration database; Tourism: Max Roser, "Tourism," *Our World in Data*, 2017 and *Tourism Economics*.

The WTO's chief economist talks to Radio Davos," *World Economic Forum*, January 30, 2025.
- 8 Chelsey Dulaney, "Tariff Front-Running Drove Irish Pharma Exports to U.S. up 833%," *The Wall Street Journal*, May 15, 2025.
- 9 This measure is based on the Finger-Kreinin measure of "export similarity." To measure change over time, we compare the composition of a country's flows across partner countries to the composition of the same country's flows in the previous year. To reverse this measure from indicating similarity to indicating difference (change), we subtract the result from 1 and rescale the result between 0 and 100 for more convenient presentation. At the global level, we use flow-weighted averages of the country-level measures. For background on the Finger-Kreinin measure, refer to J. M. Finger and M. E. Kreinin, "A Measure of 'Export Similarity' and Its Possible Uses," *The Economic Journal*, Vol. 89, No. 356, December 1979.
- 10 Here and in later sections, goods trade patterns in 2025 are based on data from January to September, and announced greenfield FDI patterns in 2025 are based on data from January to November.
- 11 Data Sources: IMF International Trade in Goods, UN Comtrade, Financial Times fDi Markets, SDC Platinum, CPT Single Window, China Customs, CEPII Gravity.
- 12 Data Sources: IMF International Trade in Goods, UN Comtrade, Financial Times fDi Markets, SDC Platinum, CPT Single Window, China Customs. Note: Geopolitical distance calculated according to 2019–23 UN General Assembly votes (rescaled 0–100), based on the Ideal Point Distance measure reported by Bailey, M. A., Strezhnev, A., & Voeten, E. 2017. Estimating Dynamic State Preferences from United Nations Voting Data. *The Journal of Conflict Resolution*, 61(2): 430–56.
- 13 The diversification index can be interpreted as the probability of any two randomly selected units (trade dollars, greenfield FDI projects, or M&A transactions) having different partners. When a given country is only closely connected to one partner, this becomes very unlikely (near 0), whereas for a country with many partners, it will become very likely (near 1).
- 14 Breadth is calculated as a Finger-Kreinin index. For more information, refer to Section 8, page 95.
- 15 Srividya Jandhyala, *The Great Disruption*, Cambridge University Press, 2025.
- 16 Data Sources: IMF International Trade in Goods, UN Comtrade, Financial Times fDi Markets, SDC Platinum, CPT Single Window, China Customs.
- 17 Data Sources: IMF International Trade in Goods, UN Comtrade, Financial Times fDi Markets, SDC Platinum, CPT Single Window, China Customs.

## NOTES SECTION 3

### ARE GLOBAL FLOWS STILL GROWING?

- 1 The WTO's April 2025 Global Trade Outlook and Statistics report predicted a 0.2% trade volume decline in 2025. By October 2025, the WTO expected global trade to expand at a 2.4% annual rate in 2025, close to the 2.8% growth rate recorded in 2024 (see October 2025 WTO Global Trade Outlook and Statistics report). The IMF's October 2025 World Economic Outlook predicted global goods exports and imports volumes to grow 3.7% and 3.2% respectively, faster than the 3.0% and 2.5% growth rates recorded in 2024.
- 2 This comparison holds based on both January to November actual global trade volume growth (as reported by CPB World Trade Monitor) and based on projected full-year growth using composite forecasts drawn from IMF World Economic Outlook, Economist Intelligence Unit, Oxford Economics, and S&P Global Market Intelligence following the methodology employed in Steven A. Altman and Caroline R. Bastian, DHL Trade Atlas 2025, DHL Group, 2025.
- 3 This pattern has raised concerns about indirect trade flowing from China to the U.S. via third countries. For related analysis, see the box titled "U.S. Continued Reliance on Goods from China" on p. 52.
- 4 China trade value data based on China Customs (Monthly Bulletin released January 8, 2026).
- 5 WTO, "Global Trade Outlook and Statistics, Update: October 2025," 2025; WTO, "World trade volume remained flat in Q3 of 2025 while its dollar value hit record high," January 28, 2026.
- 6 Composite forecast drawn from IMF World Economic Outlook, Economist Intelligence Unit, Oxford Economics, and S&P Global Market Intelligence, following methodology employed in Steven A. Altman and Caroline R. Bastian, DHL Trade Atlas 2025, DHL Group, 2025.
- 7 Yale Budget Lab, "State of Tariffs: January 19, 2026".
- 8 FDI stocks data from UNCTAD World Investment Report 2025; GDP and stock market capitalization data from World Bank World Development Indicators, accessed December 2025.
- 9 "An EU-Mercosur trade deal looks close to ratification," *The Economist*, November 4, 2025; Sultan Anshori, "Indonesia, EU seal trade deal, hope to offset Trump tariffs," *Reuters*, September 23, 2025; Juan Carlos Baker, Antoni Esteveadoral, and Ernesto Talvi, "The new EU-Mexico agreement: the EU fast-tracks integration with Latin America," Elcano Royal Institute, February 3, 2025.
- 10 "Not just 'mother of all deals': FTA with EU and 7 other trade pacts signed by India since 2021," *Times of India*, January 27, 2026.
- 11 Damian Zane, "China ready to drop all tariffs on African imports," *BBC*, June 12, 2025; Rozanna Latiff and Danial Azhar, "China and ASEAN, hit by US tariffs, sign upgraded free trade pact," *Reuters*, October 28, 2025.
- 12 Peter Foster, Ilya Gridneff, Andy Bounds, and Owen Walker, "EU eyes closer ties to transpacific bloc as Trump jolts trade order," *Financial Times*, May 4, 2025.
- 13 Sectoral export intensities reported in this paragraph are based on origin sector (OS) rather than exporting sector (ES). This means that services value embedded in exported goods is counted as part of services exports. For additional explanation, refer to Section 6 of Steven A. Altman and Caroline R. Bastian, "DHL Trade Atlas 2025," DHL Group 2025.
- 14 Calculated based on origin sector (OS). For additional explanation, refer to Section 6 and Appendix A of Steven A. Altman and Caroline R. Bastian, "DHL Trade Atlas 2025," DHL Group 2025, and for alternative results by exporting sector (ES) using 2023 data, refer to Appendix A of the same publication.
- 15 World Bank, "Trading for Development in the Age of Global Value Chains," World Development Report, 2020. For a very up-to-date and extensive analysis of recent developments in global value chains, refer to University of International Business and Economics, Asian Development Bank, Institute of Developing Economies–Japan External Trade Organization, World Economic Forum and World Trade Organization, "Global Value Chain Development Report 2025," 2025.
- 16 These values are as reported in Table 1 on p. 13 of University of International Business and Economics, Asian Development Bank, Institute of Developing Economies – Japan External Trade Organization, World Economic Forum and World Trade Organization, "Global Value Chain Development Report 2025," 2025. For simpler presentation, we describe Export Sector Backward GVC Participation as indicative of the share of exports value coming from imported inputs, and we refer to GVC Sector Average Production Length as the average number of stages in GVCs. Average production length refers to the "average number of stages separating domestic value-added creation by primary factors of production to final consumption." Backward GVC participation is measured as foreign value added (FVA) + pure double counting (PDC)/gross exports. For data and complete technical background, refer to <https://kiddb.adb.org/globalization/gvc>.
- 17 The average distance graph in Figure 3.7 is based on data from the 72-country version of the ADB MRIO exports decomposition, providing data only back to 2017. However, the same calculation performed using the 62-country version (which contains annual data back to 2007 along with data for 2000) also confirms 2024 to be the year when foreign value used in exports (FVA) traversed the longest average distance.
- 18 UNCTAD Global Investment Trends Monitor No. 50 (January 2026) and No. 49 (October 2025).
- 19 Jens Kengelbach, Daniel Friedman, and Dominik Degen, "M&A Outlook 2026: Expectations Are High—Again," Boston Consulting Group, January 15, 2026.
- 20 Other sources have reached similar conclusions based on analysis of M&A transactions during the first half of 2025. Goldman Sachs reported that the international share of M&A transactions reached a five-year high during the first half of 2025, and McKinsey reported a stable share of cross-regional M&A deals. As of November 2025, the Institute for Mergers, Acquisitions, and Alliances forecast an increase in both the number and the value of cross-border M&A transactions during the full year of 2025. See Goldman Sachs, "2H 2025 Outlook: Global M&A: A Bold Path for Strategic Growth," July 17, 2025; McKinsey & Company, "Rich in resilience: Dealmakers deliver strong first-half results in M&A," August 7, 2025; IMMA M&A Statistics by Transaction Type web page (<https://imaa-institute.org/mergers-and-acquisitions-statistics/ma-statistics-by-transaction-type/>).
- 21 Based on data available as of December 2025.

- 30 The material on foreign sales shares reported here was drawn from various editions of Morningstar Indexes Global Revenue (Domestic Revenue %) Map, featured in regular Morningstar publications authored by Dan Lefkowitz. Note that these values are based on indexes that are weighted by market capitalization, making the results most reflective of patterns in larger firms. For additional recent research on this topic, see Winfried Ruigrok, Wei Lin, and Xiaoxu Zhang, "The S-Shaped Internationalisation Pattern of UK Multinational Enterprises: An Empirical Investigation 2001–2022," Chapter 11 in Vahid J. Sadeghi, Razieh Sadraei, Surender Munjal, Sangeeta Khorana (editors), *Navigating Disruptions and Transformations in International Business*, Palgrave MacMillan, 2025; Winfried Ruigrok, Wei Lin, Xiaoxu Zhang, "Alike but a world of difference: an analysis of internationalization trajectories of Italy's and Spain's largest companies from 2001 to 2022," *Journal of Industrial and Business Economics*, Volume 52, 2025.
- 31 TeleGeography, "The State of the Network 2025 Edition," 2025; TeleGeography, "IP Networks Research Service Executive Summary," 2025; TeleGeography State of the Network 2022 edition," 2022.
- 32 See "The Global Cooperation Barometer 2024," World Economic Forum in Collaboration with McKinsey & Company, 2024.
- 33 A recent study reported an almost monotonic increase in the proportion of internationally collaborative research papers from 3% in 1980 to 25% in 2018. See Zhigang Hu, Wencan Tian, Jiacheng Guo, and Xianwen Wang, "Mapping research collaborations in different countries and regions: 1980–2019," *Scientometrics*, May 2020. Another study finds an increase from 10% internationally coauthored research papers in 1990 to 25% in 2011. See Caroline S. Wagner, Han Woo Park, and Loet Leydesdorff, "The Continuing Growth of Global Cooperation Networks in Research: A Conundrum for National Governments," *PLOS One*, July 2015. Data from the U.S. National Science Foundation show an increase from 12% in 1996 to 23% in 2020—a compound annual growth rate of just under 3%.
- 34 Based on a large sample of articles indexed in the Web of Science database. The Web of Science, a service of Clarivate Analytics, provides various indexes of scholarly publications. Our analysis covered all publications of type "article" in three of the core indexes: Science Citation Index Expanded (SCI-EXPANDED), Social Sciences Citation Index (SSCI), and Arts & Humanities Citation Index (A&HCI). We restricted to publications that were classified as articles.
- 35 Caroline S. Wagner, Han Woo Park, and Loet Leydesdorff, "The Continuing Growth of Global Cooperation Networks in Research: A Conundrum for National Governments," *PLOS One*, July 2015.
- 36 World Bank World Development Indicators.
- 37 Calculated based on data from the World Intellectual Property Organization (WIPO).
- 38 See, for example, Jianwei Dang and Kazuyuki Motohashi, "Patent statistics: A good indicator for innovation in China? Patent subsidy program impacts on patent quality," *China Economic Review* 35, 2015; Alex He, "What Do China's High Patent Numbers Really Mean?," Centre for international Governance Innovation, April 20, 2021.

- 43 Steven A. Altman and Caroline R. Bastian, "DHL Global Connectedness Index 2022," Deutsche Post DHL Group, 2022, p. 49.
- 44 Stories about countries other than the country where the newspaper is based. Calculation based on a sample of 66 major newspapers from 21 countries, identified as major media sources in those countries by the BBC. Geocoding of news stories in these publications was obtained from Factiva in order to calculate the share of international news stories.
- 45 UN Tourism, "Tourism Dashboard," accessed February 2026.
- 46 Calculated using available Inbound and Domestic Tourism data from the UNWTO. The precision of this figure should not be overstated; among other data limitations, many countries do not report the number of domestic trips. Therefore, the DHL Global Connectedness Index measures the depth of international tourism using an alternative measure: international tourist arrivals per capita.
- 47 Preliminary data reported in Julie Baer and Sumeyra Ekin, "Fall 2025 Snapshot on International Student Enrollment," IIE (joint survey), November 2025.

menting?" WTO Staff Working Paper ERSD-2023-10, October 11, 2024; Gita  
Gopinath, Pierre-Olivier Gourinchas, Andrea F. Presbitero, Petia Topalova,  
"Changing Global Linkages: A New Cold War?" April 5, 2024; UNCTAD Global  
Trade Update, December 2025.
- 7 Shekhar Aiyar, Jiaqian Chen, Christian Ebeke, Roberto Garcia-Saltos, Tryg-  
gvi Gudmundsson, Anna Ilyina, Alvar Kangur, Tansaya Kunaratskul, Sergio  
Rodriguez, Michele Ruta, Tatjana Schulze, Gabriel Soderberg, and Juan Pedro  
Trevino, "Geoeconomic Fragmentation and the Future of Multilateralism," IMF  
Staff Discussion Note SDN 2023/001, January 2023.
- 8 For goods exports and imports, the 2025 data reflect the first nine months  
of the year. For announced greenfield FDI, the 2025 data reflect the first 11  
months of the year. For scientific research collaboration, 2025 values reflect  
available data in the Web of Science database as of December 2025. For emi-  
grants and immigrants, 2015 data substitute for 2016 data. For additional  
background on the indicators employed in this analysis:
  - Goods exports and imports are based on reported (gross) values in U.S.  
dollars.
  - Outward announced greenfield FDI reflects companies from the focal coun-  
try announcing plans to build or expand operations in foreign countries.  
Inward announced greenfield FDI reflects announced plans by foreign com-  
panies to build or expand operations in the focal country.
  - Outward announced M&A transactions reflect parent companies from the  
focal country announcing that they are buying companies based in foreign  
countries. Inward announced M&A transactions reflect announced purchases  
by foreign parent companies of companies based in the focal country.
  - Portfolio equity assets stocks reflect year-end values of accumulated portfo-  
lio equity investment from the focal country in foreign countries.
  - Scientific research collaboration is measured based on the locations of  
the authors of internationally coauthored research publications. It reflects  
authors located in the focal country coauthoring publications with authors  
from other countries.
  - Emigrants are people born in the focal country who are living in foreign coun-  
tries, and immigrants are foreign born residents of the focal country.
  - Tourist arrivals are residents of foreign countries visiting the focal country  
for any purpose (including business travelers).
- 9 Average shares across flows are computed as weighted averages across pil-  
lars, using the same weights as in the DHL Global Connectedness Index (35%  
each for trade and capital, 15% each for information and people). Within pil-  
lars, flows are weighted equally.
- 10 The data and methods used here are different from those used to compute  
the shares of flows reported in the country profiles at the back of this report  
(which are explained on p. 114). As reported in the maps in the country pro-  
files at the back of this report, 12% of China's aggregate flows were with the  
U.S., while 6% of the U.S.'s flows were with China in 2024.
- 11 As shown in the dotted yellow line in the Goods Exports panel of Figure 4.2,  
the share of the rest of the world's exports going to China also fell in 2025.  
The relative weakness of China's total imports explains why the share of U.S.  
exports going to China fell more sharply than the share of China's imports  
coming from the U.S.
- 12 Caroline Freund, Aaditya Mattoo, Alen Mulabdic, and Michele Ruta, "Is US  
Trade Policy Reshaping Global Supply Chains?," *Journal of International Eco-  
nomics*, Volume 152, November 2024; Chad P. Bown, "Four years into the trade  
war, are the U.S. and China decoupling?," Peterson Institute for International  
Economics, October 20, 2022.
- 13 Note that the data employed here are counts of announced transactions,  
rather than the value of announced (or completed) transactions. Focusing on  
announced transactions improves the timeliness of the data and helps to avoid  
showing results that primarily reflect a small number of very large transac-  
tions.
- 14 The U.S. share of the rest of the world's outbound M&A transactions declined  
modestly and much less than the U.S. share of China's outbound M&A transac-  
tions.
- 15 Caroline Freund, Aaditya Mattoo, Alen Mulabdic, and Michele Ruta, "Is US  
Trade Policy Reshaping Global Supply Chains?," *Journal of International Eco-  
nomics*, Volume 152, November 2024; Laura Alfaro and Davin Chor, "Global  
Supply Chains: The Looming 'Great Reallocation'," NBER Working Paper  
31661, September 2023; Ebehi Iyoha, Edmund Malesky, Jaya Wen, Sung-Ju  
Wu, and Bo Feng, "Exports in Disguise?: Trade Rerouting during the US-China  
Trade War," Harvard Business School Working Paper 24-072, May 24, 2024.
- 16 More technically, this measures the share of "value added" from China that is  
"absorbed" in the U.S. economy, considering only value originating in goods-  
producing sectors. This was calculated based on the Asian Development  
Bank's Multi-Regional Input Output tables (62-country version in current  
prices) by dividing value added from China in U.S. final consumption, gross  
fixed capital formation, and changes in inventories and valuables by value  
added from all countries except the United States in the same categories.
- 17 Peter Foster, Amy Borrett, and A. Anantha Lakshmi, "How south-east Asia is  
riding out Trump's tariff storm," *Financial Times*, January 5, 2026.
- 18 For recent analysis of China's rising scientific production, including inter-  
national and domestic research collaborations, see Niccolò Pisani, Hanjo D.  
Boekhout, Eelke M. Heemskerk, and Frank W. Takes, "China's rise as global  
scientific powerhouse: A trajectory of international collaboration and special-  
ization in high-impact research," *Research Policy* 54(1), October 2025.
- 19 Measured based on all flows included on the breadth dimension of the DHL  
Global Connectedness Index, using the methodology employed to aggregate  
flows for the maps displayed in the Country Profiles at the back of this report.
- 20 We use here the 2025 update of this classification described in Mark Williams,  
Julian Evans-Pritchard, and Rhydian Walsh, "The Shape of the Fractured World  
in 2025" *Capital Economics*, January 17, 2025. Further details are available  
in the original publication, Julian Evans-Pritchard and Mark Williams, "China  
Economics Focus: Mapping Decoupling," *Capital Economics*, September 17,  
2021.
- 21 Michael A. Bailey, Anton Strezhnev, and Erik Voeten, "Estimating dynamic state  
preferences from United Nations voting data," *Journal of Conflict Resolution*  
61, no. 2, 2017.

**22** All other countries are classified as close allies of the U.S. or China, leaning toward the U.S. or China, or as unaligned. In our analysis, we focus only on countries designated as close allies, since early evidence of decoupling or fragmentation is most likely to appear among countries with stronger geopolitical alignments. For our analysis, we also assume that a small number of economies that are not included in the Capital Economics classifications are close allies of neither the U.S. nor China (we consider them as unaligned). The criteria used by Capital Economics to classify countries were:

- Alignment on the UN's Human Rights Commission
- Territorial dispute with China?
- Official Bridge and Road Initiative (BRI) participant?
- Attended the 2021 BRI conference?
- Official Build Back Better World participant?
- UN General Assembly voting alignment
- Net public opinion (% favorable, U.S. minus China, latest)
- U.S./China military presence
- Security alliance (NATO, SCO, etc.)
- EU membership?
- Full diplomatic relations with Taiwan?
- Overseas territory or dependency (of China or U.S./ally)?
- Goods exports to U.S. minus exports to China (% of GDP)
- Services exports to U.S. minus exports to China (% of GDP)
- Total exports to U.S. minus exports to China (% of GDP)
- FDI flow, U.S. minus China (% of GDP)
- FDI stock, U.S. minus China (% of GDP)
- Aid from DAC countries (% of GNI)
- Public borrowing from U.S. vs. China (% of GDP)

**23** For a discussion of alternative approaches and limitations, see Erik Voeten, "Conceptualizing and Measuring Geopolitical Alignments," Working Paper, 2025.

**24** Michael A. Bailey, Anton Strezhnev, and Erik Voeten, "Estimating dynamic state preferences from United Nations voting data," *Journal of Conflict Resolution* 61, no. 2, 2017.

## NOTES SECTION 5

### IS GLOBALIZATION GIVING WAY TO REGIONALIZATION?

- 1 See, for example, Joergen Oerstroem Moeller, "From Globalization to Regionalization," *YaleGlobal*, October 30, 2018; Shannon K. O'Neil, "The Myth of the Global: Why Regional Ties Win the Day," *Foreign Affairs*, July/August 2022; Rana Foroohar, *Homecoming: The Path to Prosperity in a Post-Global World*, Crown, 2022; Peter Enderwick and Peter Buckley, "Rising regionalization: will the post-COVID-19 world see a retreat from globalization?" *Transnational Corporations*, 27.2, 2020; Niccolò Pisani, "How COVID-19 Will Change the Geography of Competition," *MIT Sloan Management Review*, May 13, 2021; Susan Lund, James Manyika, Lola Woetzel, Jacques Bughin, Mekala Krishnan, Jeongmin Seong, and Mac Muir, "Globalization in transition: The future of trade and value chains," McKinsey Global Institute, January 16, 2019.
- 2 Steven A. Altman and Caroline R. Bastian, "Trade Regionalization: More Hype Than Reality?," *Harvard Business Review*, May 31, 2022.
- 3 This general pattern is subject to exceptions. Average flow distances can change without changes in the intra-regional share of flows when: (a) there are shifts in the shares of total flows between regions with shorter versus longer internal average distances and (b) there are shifts in average flow distances among country-pairs within and/or between regions.
- 4 For a recent perspective on this longstanding theme in international business research, see Alain Verbeke, Chang Hoon Oh, and Rajesh Jain, "What is the future of regional multinational enterprises?" *International Business Review*, 2025.
- 5 M&A transactions became more regionalized in 2024, but that pattern did not continue in 2025. For scientific research collaboration, recent years have seen a declining share taking place within regions, even as international research collaborations have taken place over slightly shorter distances, on average. In 2025, however, the intra-regional share of this flow did increase as the average distance declined.
- 6 Intra-EU trade is included in all calculations reported in this section.
- 7 This pattern was strongest before 2008–2012, which is when we saw the largest increases in the average distance over which countries traded. See pp. 21–32 of Steven A. Altman and Caroline R. Bastian, "DHL Trade Growth Atlas 2022" Deutsche Post DHL Group, 2022. Broader shifts in economic activity are discussed on pp. 60–77 of the same publication. The same pattern has also affected trends in the intensity of world trade. See Arvind Subramanian, Martin Kessler, and Emanuele Properzi, "Trade hyperglobalization is dead. Long live...?," PIIE Working Papers 23–11, November 2023.

- 20 Liz Hempel, Mike Conway, Mike Doheny, and Shubham Singhal, "Decoding disruption to reshape manufacturing footprints," McKinsey & Company, January 8, 2026.
- 21 Weighted average based on pillar and component weights.
- 22 Under frictionless benchmark assumptions, each country consumes imports from every other country in proportion to every other country's share of world output. While this type of benchmark was developed originally for trade analysis, we construct analogous benchmarks here for other flows based on the denominators of their depth ratios: gross domestic product for FDI Stock (along with Goods Exports), market capitalization for Portfolio Equity Stock, total news website traffic for Online News Traffic, total published scientific articles for Scientific Research Collaboration, population for both Tourists and Migrants, and tertiary enrollment for University Students. For additional background, refer to Keith Head and Thierry Mayer, "What Separates Us? Sources of Resistance to Globalization," *Canadian Journal of Economics/Revue canadienne d'économique* 46(4), November 2013.
- 23 Ghemawat's CAGE (Cultural, Administrative, Geographic, Economic) distance framework was introduced in Pankaj Ghemawat, "Distance Still Matters: The Hard Reality of Global Expansion," *Harvard Business Review*, September 2001.
- 24 Estimates generated based on a standard gravity model of multiple types of economic activity. See Pankaj Ghemawat, *The New Global Road Map: Enduring Strategies for Turbulent Times*, Harvard Business Review Press, 2018, Figures 1–8.

## NOTES SECTION 6

### WHICH COUNTRIES AND REGIONS ARE THE MOST GLOBALLY CONNECTED?

- 1 See the section titled “Variation Across Countries” in Steven A. Altman, Caroline R. Bastian, and Davis Fattedad, “Challenging the deglobalization narrative: Global flows have remained resilient through successive shocks,” *Journal of International Business Policy*, Volume 7, 2024.
- 2 While earlier sections attempt to track the data into 2025, there are significant challenges in doing this at the country level, due to limits in data availability and our capacity to forecast trends at the country level. As a result, the data presented in this section are as of 2024.
- 3 The term “countries” is used throughout this report to refer to all of the countries and territories in the DHL Global Connectedness Index, regardless of their political status. The Hong Kong and Macau Special Administrative Regions (SARs) of the People’s Republic of China, as well as Taiwan, China, are treated as separate economic areas from Mainland China (unless otherwise noted). China, throughout this report, refers to Mainland China. This treatment reflects the way data on these areas are covered in our primary data sources, i.e., with data for Hong Kong, Macau, and Taiwan reported separately from Mainland China. Other countries with overseas territories have differing policies on whether official statistics for those countries include those territories and we do not make any adjustments to include or exclude them from this analysis.
- 4 Breadth scores are measured using a Finger-Kreinin index. See Section 8 for more information.
- 5 Income levels are measured using nominal GDP per capita.
- 6 At the overall level, logged GDP per capita had a correlation of 0.75 with DHL Global Connectedness Index score in 2024, which is highly statistically significant ( $p < 0.0001$ ).
- 7 For further discussion on the multifaceted relationship between connectedness and prosperity, refer to pp. 16–20 of Steven A. Altman and Caroline R. Bastian, “Connecting to the World: Lessons from 10 Years of the DHL Global Connectedness Index,” Deutsche Post DHL Group, 2021.
- 8 The DHL Global Connectedness Index 2016 report featured a ranking of global cities both as “hotspots” and “giants,” and Singapore ranked first on both measures.
- 9 See “About: Languages in Luxembourg,” Information and press service of the Luxembourg government, September 2025.
- 10 The Netherlands ranked first on the DHL Global Connectedness Index in all editions from 2011 to 2022, but now ranks third, largely in response to changes in composition of the index and methodological changes made in 2024 and carried into this edition. Using the current methodology and composition, the Netherlands has ranked between third and fourth in most years going back to 2001, reaching a high of second in 2022.
- 11 Authors’ calculations based on Thierry Mayer and Soledad Zignago, “Notes on CEPII’s distances measures: the GeoDist database,” CEPII Working Paper 2011–25.
- 12 This figure and discussion is based on content from Steven A. Altman and Caroline R. Bastian, “Connecting to the World: Lessons from 10 Years of the DHL Global Connectedness Index,” Deutsche Post DHL Group, 2021.
- 13 See World Bank, “Lebanon Economic Monitor: Turning the Tide?” Spring 2025, DOI: 10.1596/43357.
- 14 Libya has yet to ratify the agreement.
- 15 This is a simple average of all country scores in the region. Scores for countries that are not reported due to data limitations have been imputed.
- 16 Note that the four freedoms also apply beyond the EU to the other member countries of the European Economic Area (EEA): Iceland, Liechtenstein, Norway, and, with some limitations, Switzerland. Until the end of the transition period in 2020, the United Kingdom also participated in the four freedoms. As members of the Deep and Comprehensive Free Trade Area (DCFTA), Georgia, Moldova, and Ukraine also participate in the four freedoms in a more limited way.
- 17 Institute for Intercultural Diplomacy, “The Berlin International Freedom of Expression Forum: Censorship and Freedom in Traditional and New Media: The Revolution of Media as a tool of Freedom of Expression,” Presentation at the Berlin International Conference, February 28–March 2, 2012.
- 18 IMF World Economic Outlook.

## NOTES SECTION 7

### CONCLUSION

- 1 This 5 P's framing of the deglobalization debate was introduced in Steven A. Altman, Caroline R. Bastian, and Davis Fattedad, "Challenging the deglobalization narrative: Global flows have remained resilient through successive shocks," *Journal of International Business Policy*, Volume 7, 2024.
- 2 Gallup, "Americans' Foreign Policy Priorities, NATO Support Unchanged," March 4, 2025. Support for trade increased across Republicans, Democrats and Independents, with the largest increase among Republicans, who tend to be more supportive of trade when their party controls the White House. Further support for a pro-globalization shift in U.S. public opinion comes from polling by the Chicago Council on Global Affairs showing that the share of Americans favoring a policy of global free trade increased from 35% in 2024 to 55% in 2025. Chicago Council on Global Affairs, "Most Americans Think the United States Should Pursue Global Free Trade," May 5, 2025.
- 3 Ipsos, "The Uneasy Decade: Reshaping Society, Technology, and the Global Economy," *Global Trends*, 9<sup>th</sup> Edition, September 2025.
- 4 This was down slightly from 66% in 2023, but up substantially from 48% in 2021 (across a smaller set of countries). Ipsos, "The Uneasy Decade: Reshaping Society, Technology, and the Global Economy," *Global Trends*, 9<sup>th</sup> Edition, September 2025; Ipsos, "A New World Disorder? Navigating a Polycrisis: *Global Trends 2023*," 2023; Ipsos, "World Opinion on Globalization and International Trade in 2021," Ipsos Global Advisory 25-Country Survey for the World Economic forum, 2021.
- 5 Simon Evenett, Adam Jakubik, Jaden Kim, Fernando Martín, Samuel Pienknagura, Michele Ruta, Sandra Baquie, Yueling Huang, and Rafael Machado Pariente, "Industrial Policy Since the Great Financial Crisis," IMF Working Paper, October 31, 2025.
- 6 Surveys have shown double-digit shares of companies planning on or implementing nearshoring strategies as far back as 2012. For example, according to a May 2012 survey by AlixPartners, almost half of manufacturing executives surveyed said their companies were considering nearshoring, and about 35% had already begun moving production closer to home. See Eric Kulisch, "Right Shoring," *FreightWaves*, May 21, 2012.
- 7 Steven A. Altman and Caroline R. Bastian, "Trade Regionalization: More Hype than Reality?" *Harvard Business Review*, May 31, 2022.
- 8 For U.S. company examples, see Megan Cerullo, "These companies say they're investing more in U.S. manufacturing as tariffs go into effect," *CBS News*, April 30, 2025. Greenfield FDI data from Financial Times fDi Markets database. Regarding Chinese companies, see "A new generation of Chinese companies is expanding around the world," *The Economist*, January 13, 2026. China's BYD presents an especially prominent example. The company announced in 2025 a target to raise its overseas sales to half of the company's total by 2030, from roughly 10% in 2024. See Brenda Goh and Nick Carey, "Exclusive: BYD aims to sell half its cars outside China by 2030, sources say," *Reuters*, May 8, 2025.

- 25 Based on long-run GDP forecasts from Oxford Economics.

## NOTES SECTION 8

### INDEX METHODOLOGY AND DATA SOURCES

- 1 The focus on actual flows is motivated by the fact that, while connectivity or the technical potential for connectedness has improved a great deal thanks to changes in transportation and communications technologies, actual levels of flows significantly lag that potential. By focusing the index itself on actual flows, it can be used more effectively to analyze both the effectiveness of policies aimed at shaping international flows and the effects of international flows.
- 2 Breadth is measured using a Finger-Kreinin index. See J. M. Finger, M. E. Kreinin, "A Measure of 'Export Similarity' and Its Possible Uses," *The Economic Journal*, Vol. 89, No. 356, Dec. 1979, pp. 905–912.
- 3 The selection of these four categories also draws support from definitions of globalization drawn from various research fields. Thus, for example, writings about globalization by economist Michael Mussa cite "trade, factor movements (of capital and people) and communication of economically useful knowledge and technology," while those by anthropologist Arjun Appadurai mention "ideas and ideologies, people and goods, images and messages, technologies and techniques." See Michael Mussa, "Factors driving global economic integration," paper presented at Global economic integration: Opportunities and challenges conference, Jackson Hole, Wyoming, USA, August 25, 2000, and Arjun Appadurai, "Grassroots globalization and the research imagination," *Public Culture* 12 (1):1–19, 2000.
- 4 For announced greenfield FDI and M&A Transactions, we use the value (in U.S. dollars) of these transactions in the depth analysis (since the focus for depth is the magnitude of cross-country interactions) and the number (count) of transactions in the breadth analysis (where counts enable us to see a more stable picture of geographic patterns and also provide a view of location choices that better reflects typical patterns rather than just those pertaining to the largest transactions). For M&A transactions, specifically, the depth data pertain to the net value of cross-border M&A purchases and sales, while the breadth data pertain to counts of announced transactions for which the target company and the ultimate parent company of the buyer are located in different countries.
- 5 Coverage is deemed to be sufficiently complete when data on flows between a given reporter and all partner countries sum to between 80% and 110% of the reported total for the world.
- 6 This measure has been developed independently in several domains, but is typically called a Finger-Kreinin Index in the economic literature. See J.M. Finger and M.E. Kreinin, "A Measure of 'Export Similarity' and its Possible Uses," *The Economic Journal*, Vol. 89, No. 356, Dec. 1979, pp. 905–912.
- 7 Such hypotheticals have been employed extensively in international trade research. See, for example, James A. Anderson, "The Gravity Model," *Annual Review of Economics* 3, no. 1, 2011; Arvind Subramanian and Martin Kessler, "The Hyperglobalization of Trade and Its Future," PIIE Working Paper 13–6, Peterson Institute for International Economics, 2013; Paul Krugman, "Growing World Trade: Causes and Consequences," *Brookings Papers on Economic Activity*, 1995; Elhanan Helpman, "Imperfect Competition and International Trade: Evidence from Fourteen Industrial Countries," *Journal of the Japanese and International Economies*, 1, no. 1, 1987.
- 8 While the Online News Traffic indicator is not allocated any weight for global trends (because data are not available before 2022), this indicator is used for setting the proxy level for the information pillar for purposes of scaling depth indicators that are not in the form international/total relative to frictionless hypothetical levels.
- 9 The geometric mean is simply the square root of the product of the depth and breadth scores.
- 10 See, for example, Alan Mauldin, "International Bandwidth Demand Surpasses 6.4 Pbps," *Telegeography Blog*, May 12, 2025.

## HOW TO READ THE COUNTRY PROFILES

### Key Scores and Trends

The upper left corner of each profile summarizes the country's overall global connectedness score, as well as its scores by dimension (depth vs. breadth) and pillar (trade, capital, information, and people). Scores and ranks from 2024 and 2019 are shown alongside the numerical change seen in each category over the five-year period. Changes in scores indicate shifts in absolute levels of connectedness. Changes in ranks provide comparisons of a country's relative standing among the countries covered in the index. Changes in scores are calculated using rounded numbers.

### Connectedness Score Trend

Below the scores summary, each profile contains a line chart showing the country's overall trend. Because of the differences between global versus country calculation methods (described in Section 8), these Score Trend charts by country should not be compared to the global trend charts in Section 2 of the report.

### Depth

The depth section provides each country's outward and inward depth scores and ranks at the pillar and component levels.

**Outward/Inward:** Results are reported separately by direction. For example, outward trade flows refer to exports, inward trade flows refer to imports.

**Ranks:** Each of the ranks is followed by a slash (/) and the number of countries for which data are available for that metric. For example, Singapore's rank of 5/166 for Outward FDI Stock (% of GDP) means that Singapore has the 5th highest score on that component, out of 166 countries for which data are available.

**Levels:** Depth levels are reported using measures that compare international flows and stocks to relevant indicators of the size of a country's domestic economy. The units depend on the domestic comparison employed, and are described in parentheses after each component's name.

For data sources, refer to Appendix A.

### Geographic and Geopolitical Distance

This section provides additional breadth-related context for each country. At the overall level, as well as for each of the pillars, there is a rank and a level shown for:

- Average distance traversed by flows in kilometers
- Percent of flows that are with other countries in the same region (see Appendix A for a list of regions)
- Average geopolitical distance, based on UN Voting Patterns (see p. 57)
- Percent of flows with the U.S. and China and close allies of those countries as classified by Capital Economics (see p. 57)
- The Herfindahl-Hirschman Index of concentration (complement of diversification across partner countries)

Region: East Asia &amp; Pacific

### Rooted Map

The upper right corner of each profile contains a map where all other countries are sized in proportion to their shares of the profiled country's international flows, and are colored based on the profiled country's share of their international flows. Thus, these maps highlight both the countries that are most connected to the profiled country (using sizes) and the countries for which connections to the profiled country are most salient (using colors). The profiled countries themselves are sized to 10% of the total land area and colored in red, focusing these maps only on the breadth of countries' international flows rather than attempting to combine depth and breadth perspectives on the same maps.

For additional details, as well as an example of how to interpret a rooted map, please turn to the next page.

### Breadth

The breadth section parallels the depth section described to the left. As described in detail in Section 8, breadth measures how closely a country's distribution of a flow mirrors the rest of the world's shares of that flow in the opposite direction. Breadth scores are scaled between 0% and 100%, with 0% representing no similarity between the country's flows and the rest of the world's flows, and 100% representing a perfect match between the country's flows and the rest of the world's flows. In 2024, the lowest breadth score for any country and flow was 0% and the highest was 90%.

For data sources, refer to Appendix A.

### Legend

The “—” symbol for Not Applicable is used in the depth and breadth sections to identify cells in the tables that are not filled in for any country. Levels can only be calculated at the component level, so this symbol always appears in the level columns of the pillar rows. In breadth, this symbol also appears in the cells that refer to components that are excluded from breadth (but covered in depth), due to data constraints. The “.” symbol indicates that a particular cell could not be filled in for the profiled country due to limitations in the available data for that specific country.

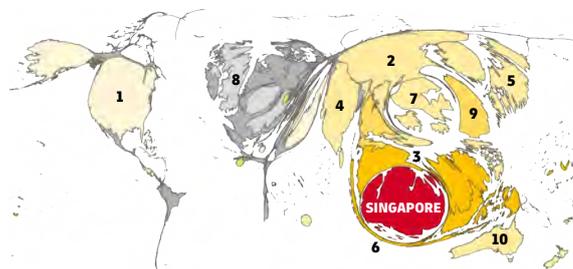

*Italicized* numbers indicate that the value shown was imputed based on prior year data using a statistical model, as described in Section 8.

### Region

The text at the top right of the Geographical and Geopolitical Distance table indicates the region where the profiled country is located. A full listing of all countries in each region can be found at the end of Appendix A.

## HOW TO READ THE ROOTED MAPS

### Overview

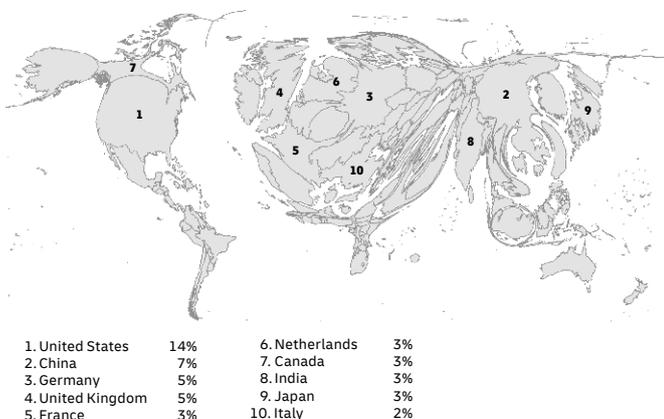

Rooted maps depict the size of countries' international flows in geographic space. Each map is drawn from the perspective of a specific focal country, as illustrated by the example of Viet Nam on the following page. These maps highlight how international flows typically diminish with physical distance as well as with cultural, political, and other types of differences.

**Country Sizes Are Based on Shares of a Focal Country's International Flows:** They are warped using an algorithm that roughly maintains the shapes of countries' borders, but sizes them according to their flows with the focal country. More specifically, country sizes represent countries' shares (in percentage terms) of the focal country's total international trade, capital, information, and people flows. Thus, apart from the focal country itself, which is not re-sized based on data, the largest countries on each map are those

with which the focal country has its largest international flows. The top 10 countries are labeled, and their shares of the focal country's total flows are listed. Note that countries' actual sizes in terms of land area are not considered in calculating country sizes on rooted maps; countries may either expand or contract to depict the appropriate data.

**Country Colors Are Based on a Focal Country's Share of Other Countries' International Flows:** Different shades of yellow and gray denote the share of each partner's flows with the focal country. This indicates how important flows to and from the focal country are for other countries. It also facilitates comparisons of the focal country's connectedness across other countries of different sizes.

### Reference Map

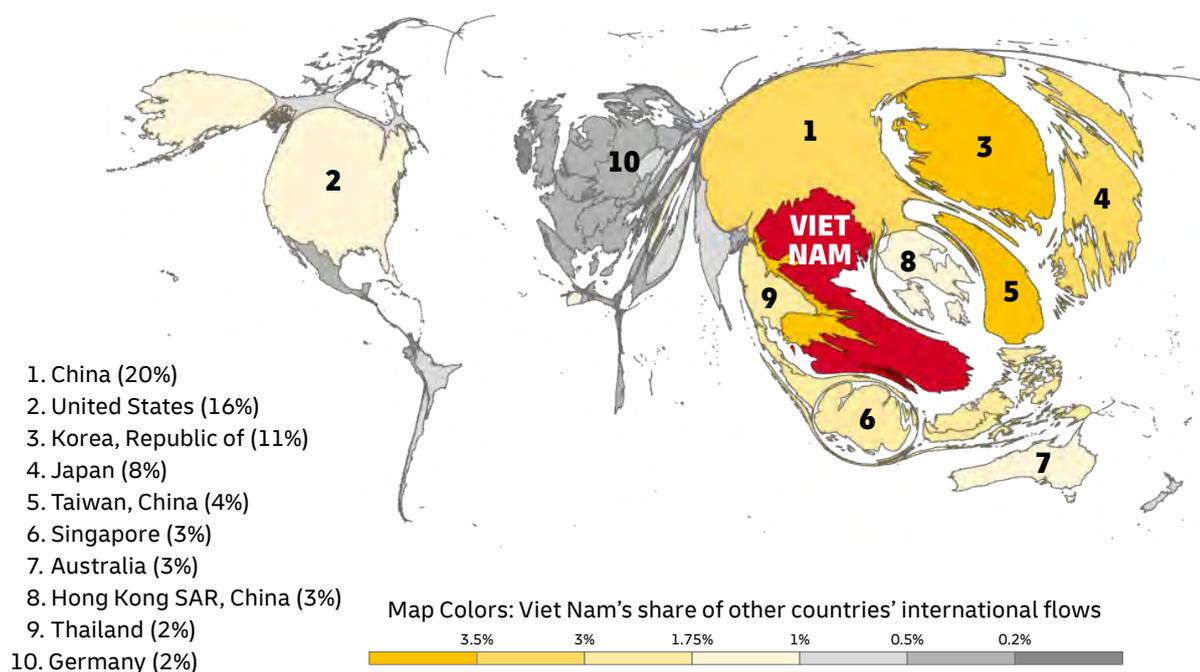

Further insight can be gleaned from comparing countries' sizes on rooted maps to their sizes on a reference map (i.e., a similar map that is not drawn from the perspective of a specific focal country). The reference map shown above sizes countries according to their shares of global trade, capital, information, and people flows.

Comparing Viet Nam's rooted map versus this reference map highlights how the 16% of Viet Nam's flows to/from the United States is roughly in line with the U.S.'s 14% share of global flows worldwide. We can also see that China's share of Viet Nam's flows is more than double that of the world, whereas Germany's is just under half.

### Flow Calculations

In order to produce maps that depict the most relevant flows for each country, the distributions of countries' international flows of each specific type covered on the breadth dimension of the DHL Global Connectedness Index (goods trade, FDI, etc.) were combined using a statistical model. We first calculated the share of total world flows for each country pair on each of the breadth components. Then we performed a weighted average of available components (using predictions from a weighted fixed effects model with the flow share as the response variable, country pair fixed effects as the predictors, and the standard breadth component weights, as shown in Table 8.4 on page 98). Where individual flow values were not available in 2024, we used prior years' flow shares back to 2019; if no values were available in any of the last five years, that component was skipped. These calculations were performed separately for each of the pillars and the predictions were averaged using the standard pillar weights (see Table 8.4). This process was also performed on inverted ("mirror") data, so that opposite direction flows were also considered (particularly important for flows where only one direction was available). Finally, the original and inverted results were averaged and the values were divided by the sum of all predicted shares for each country to calculate the shares used in the maps. The reference map was calculated by summing all of the predicted flow shares for each country and dividing by the world total of flows.

### Rooted Map Example: Viet Nam

**Country Sizes:** The country with the largest share (20%) of Viet Nam's international flows is China, so China is expanded to become the largest country on this map (Viet Nam itself is not sized based on data). The United States is expanded to almost the same size because its share of Viet Nam's total international flows is 16%. The Republic of Korea features in 11% of Viet Nam's international flows, followed by Japan, Taiwan (China) Singapore, Australia, and so on. Asia as a whole appears much larger than it does on a normal map because 63% of Viet Nam's international flows take place to or from other countries in Asia.

**Country Colors:** Viet Nam's share of other countries' international flows is highest for its closest neighbors to the west. Roughly 14% of Lao People's Democratic Republic's flows are with Viet Nam. Cambodia is close behind at 12%, followed by the Republic of Korea with half as much at 6%. Therefore, these three countries are colored in the brightest yellow, indicating a share of more than 6%. Most of Viet Nam's other Asian neighbors are in the 1–3.5% range, and thus are colored lighter shades of yellow. In somewhat more distant countries such as India, Viet Nam's share falls to about 0.5%, so these countries are colored in the lightest gray. Outside of Asia, Viet Nam's share of other countries' international flows is almost uniformly below 0.5%, so most of these countries are colored in darker shades of gray. The one major exception

to this pattern is the United States, where Viet Nam's share of U.S. flows is slightly higher than 1%, pointing to the unusually strong ties that have developed between Viet Nam and the U.S., despite the vast distance between them.

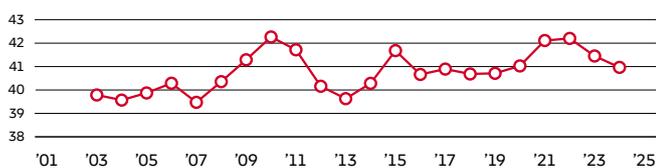

**Interpretation:** This size-based perspective highlights the importance of Asian countries for Viet Nam and hints at the power of distance to dampen international flows. Distance effects become even clearer when adding in the share-based perspective depicted in the coloring. As one moves from proximate countries with close links to Viet Nam to more distant ones, Viet Nam's shares of other countries' flows generally diminishes. Additionally, it can be useful to compare across these perspectives. For example, Lao People's Democratic Republic's share of Viet Nam's flows is less than 1%, but Viet Nam's share of Lao PDR's flows is 14%, highlighting how much larger Viet Nam looms for Lao PDR than vice versa. Similarly, the U.S. looms larger for Viet Nam (16%) than Viet Nam does for the U.S.

APPENDIX A

# **DETAILED DATA SOURCES AND DEFINITIONS**

**TABLE A.1: DATA SOURCES EMPLOYED TO CALCULATE DEPTH SCORES**

Pillar	Variable	Definition	Source
Trade	Goods Exports	Value of exports, free on board (FOB), reported by exporting countries in U.S. dollars.	World Bank World Development Indicators; Oxford Economics Global Data; IMF International Trade in Goods; UNCTAD Data Hub; Economist Intelligence Unit; IMF Balance of Payments; OECD-WTO Balanced Trade in Services dataset; UN Comtrade; IMF World Economic Outlook; S&P Global Market Intelligence
	Goods Imports	Value of imports, cost, insurance, and freight (CIF), reported by importing countries in U.S. dollars.	
	Services Exports	Value of exports of commercial services in U.S. dollars.	
	Services Imports	Value of imports of commercial services in U.S. dollars.	
	Foreign Value Added	Value added by foreign production of goods and services in current U.S. dollars at market exchange rates.	
Capital	FDI Outward Stocks	Total value of direct investment held by domestic enterprises in foreign economies at the end of the year.	UNCTAD World Investment Report
	FDI Inward Stocks	Total value of direct investment held by foreign enterprises in the domestic economy at the end of the year.	
	FDI Outflows	Net value of direct investment transactions from domestic enterprises to foreign economies during the course of the year.	
	FDI Inflows	Net value of direct investment transactions by foreign enterprises into the domestic economy during the course of the year.	
	Portfolio Equity Asset Stocks	Total value of foreign equity assets other than direct investment or foreign reserves at the end of the year.	IMF International Investment Position
	Portfolio Equity Liability Stocks	Total value of foreign equity liabilities other than direct investment and foreign reserves at the end of the year.	
	Announced Greenfield Foreign Direct Investment – Outward	Estimated value in U.S. dollars of all announced new foreign investment projects and expansion of existing projects by country of the investor that create new jobs and capital investment.	UNCTAD World Investment Report; Financial Times fDi Markets
	Announced Greenfield Foreign Direct Investment – Inward	Estimated value in U.S. dollars of all announced new foreign investment projects and expansion of existing projects by country of the investment that create new jobs and capital investment.	
	Mergers and Acquisitions Transactions – Outward	Net value of mergers and acquisitions deals in which the ultimate parent is a company in the focal country, and the purchase is 5% or greater stake in a foreign target; a 3% or greater stake with a value of more than 1 million U.S. dollars; or any stake with a value of more than 250 million U.S. dollars.	UNCTAD World Investment Report; LSEG SDC Platinum
	Mergers and Acquisitions Transactions – Inward	Net value of mergers and acquisitions deals in which the target is a company in the focal country, and the purchaser is a foreign company taking a 5% or greater stake in a target; a 3% or greater stake with a value of more than 1 million U.S. dollars; or any stake with a value of more than 250 million U.S. dollars.	

**TABLE A.1: DATA SOURCES EMPLOYED TO CALCULATE DEPTH SCORES (CONTINUED)**

<b>Pillar</b>	<b>Variable</b>	<b>Definition</b>	<b>Source</b>
Information	Online News Traffic by User	Number of visits to news websites in the highest traffic country from users in another country during the month of June, by country of user.	Similarweb
	Online News Traffic by Domain	Number of visits to news websites by users in a country other than country that provides the most traffic during the month of June, by country of website domain's highest traffic.	
	Scientific Research Collaboration	Number of articles, reviews, and notes in the Science Citation Index Expanded, Social Sciences Citation Index, and Arts & Humanities Citation Index with at least one author address listed in the focal country and at least one address in another country.	Clarivate Web of Science
	Payments for the Use of Intellectual Property	Payments for the use of proprietary rights, such as patents, trademarks, copyrights, branding, trade secrets, and performance rights in current U.S. dollars at market exchange rates.	World Bank World Development Indicators; IMF Balance of Payments
	Receipts from the Use of Intellectual Property	Receipts of charges for the use of proprietary rights, such as patents, trademarks, copyrights, branding, trade secrets, and performance rights in current U.S. dollars at market exchange rates.	
	International Patent Applications	Total count of all patent applications by non-residents received by patent offices that are parties to WIPO treaties, including regional patent offices. Excludes data from the China National Intellectual Property Administration.	World Intellectual Property Organization Statistics Database
People	Tourist Departures	Departures of overnight visitors (tourists) as recorded at national borders.	Tourism Economics (an Oxford Economics company)
	Tourist Arrivals	Arrivals of non-resident overnight visitors (tourists) at national borders.	
	Outgoing University Students	Total citizens and nationals studying in foreign degree programs at the tertiary level.	UNESCO Institute for Statistics; Ministry of Education Republic of China (Taiwan)
	Incoming University Students	Total foreign students studying in degree programs at the tertiary level.	
	Emigrants	Total people born in the focal country residing abroad.	UN DESA International Migrant Stock; OECD International Migration Database; American Community Survey
	Immigrants	Total residents born abroad.	

Note: Data sources for numerators of depth ratios are reported in the rows pertaining to the trade, capital, information, and people pillars in Table A.1. Data sources for denominators of depth ratios are listed in Table A.2.

**TABLE A.2: BENCHMARKS FOR RESCALING**

Variable	Definition	Source
Total Value Added	Value added by production of goods and services in current U.S. dollars at market exchange rates.	Asian Development Bank Multiregional Input-Output Database
Gross Domestic Product	Gross domestic product at purchaser's prices, current U.S. dollars at market exchange rates.	World Bank World Development Indicators; IMF World Economic Outlook; Oxford Economics Global Data; S&P Global Market Intelligence; Economist Intelligence Unit
Gross Fixed Capital Formation	Gross fixed capital formation, current U.S. dollars at market exchange rates. Where not reported in U.S. dollars, converted using annual average exchange rates from IMF International Financial Statistics Database.	World Bank World Development Indicators; Economist Intelligence Unit; Oxford Economics Global Data; IMF National Economic Accounts; IMF World Economic Outlook
Total M&A Transactions	Total of all mergers and acquisitions deals involving a purchase of at least a 5% stake in the target company; all deals with at least a 3% stake and a value of over 1 million U.S. dollars; and all deals with a value of more than 250 million U.S. dollars.	LSEG SDC Platinum
Market Capitalization	Total market value of all publicly traded equity securities in current U.S. dollars at market exchange rates.	Bloomberg; World Federation of Exchanges; Euromonitor Passport; World Bank World Development Indicators; World Federation of Exchanges
Total Published Scientific Articles	Total of all journal articles, reviews, and notes collected by Clarivate Web of Science in the Science Citation Index Expanded, Social Sciences Citation Index, and Arts & Humanities Citation Index with a listed address that includes a country.	Clarivate Web of Science
Total Patent Applications	Total count of all patent applications received by patent offices that are parties to WIPO treaties, including regional patent offices. Excludes data from the China National Intellectual Property Administration.	World Intellectual Property Organization Statistics Database
Population	De facto total population, both sexes, in a country as of July 1 of the year indicated; includes all residents regardless of legal status or citizenship, except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin.	IMF World Economic Outlook; World Bank World Development Indicators
Tertiary Students	Enrollment in all tertiary education programs, public and private, full-time and part-time.	UNESCO Institute for Statistics; Republic of China (Taiwan) Ministry of Education

	FDI Inward Stocks	Total value of direct investment held by foreign economies in domestic enterprises at the end of the year.		
	Portfolio Equity Outward Stocks	Total value of foreign equity assets other than direct investment or foreign reserves at the end of the year.		IMF Portfolio Investment Positions by Counterpart Economy
	Announced Greenfield Foreign Direct Investment – Outward	Count of all announced new foreign investment projects and expansion of existing projects by country of the investor that create new jobs and capital investment.		Financial Times fDi Markets
	Announced Greenfield Foreign Direct Investment – Inward	Count of all announced new foreign investment projects and expansion of existing projects by country of the investment that create new jobs and capital investment.		
	Mergers and Acquisitions Transactions – Outward	Count of mergers and acquisitions deals in which the ultimate parent is a company in the focal country, and the purchaser is taking a 5% or greater stake in a foreign target; a 3% or greater stake with a value of more than 1 million U.S. dollars; or any stake with a value of more than 250 million U.S. dollars.		LSEG SDC Platinum database
	Mergers and Acquisitions Transactions – Inward	Count of mergers and acquisitions deals in which the target is a company in the focal country, and the purchaser is a foreign company taking a 5% or greater stake in the target; a 3% or greater stake with a value of more than 1 million U.S. dollars; or any stake with a value of more than 250 million U.S. dollars.		
Information	Online News Traffic by User	Number of visits to news websites by users in a country other than the country that provides the most traffic during the month of June, by country of user.	Similarweb	
	Online News Traffic by Domain	Number of visits to news websites by users in a country other than the country that provides the most traffic during the month of June, by country of website domain's highest traffic.		
	Scientific Research Collaboration	Articles, reviews, and notes in the Science Citation Index Expanded, Social Sciences Citation Index, and Arts & Humanities Citation Index with at least one author address listed in the focal country and at least one author address listed in a foreign country.	Clarivate Web of Science	
	Payments for the Use of Intellectual Property	Payments for the use of proprietary rights, such as patents, trademarks, copyrights, branding, trade secrets, and performance rights in current U.S. dollars at market exchange rates.	OECD–WTO Balanced Trade in Services	
	Receipts from the Use of Intellectual Property	Receipts of charges for the use of proprietary rights, such as patents, trademarks, copyrights, branding, trade secrets, and performance rights in current U.S. dollars at market exchange rates.		
	International Patent Applications	Total count of all patent applications by non-residents received by patent offices that are parties to WIPO treaties, including regional patent offices. Excludes data from the China National Intellectual Property Administration.	World Intellectual Property Organization Statistics Database	

**TABLE A.3: DATA SOURCES EMPLOYED TO CALCULATE BREADTH SCORES (CONTINUED)**

Pillar	Variable	Definition	Source
People	Inbound Tourists	Arrivals of overnight tourists by country of residence or by country of nationality (using measures taken at borders or at lodging establishments, depending on data availability). Where destination countries reported more than one measure, preference was given to measures taken at borders.	Tourism Economics (an Oxford Economics company)
	Incoming International Students	Incoming students by country of origin.	UNESCO Institute for Statistics; Republic of China (Taiwan) Ministry of Education
	Emigrants	Total people born in the focal country residing abroad.	UN DESA International Migrant Stock; OECD International Migration Database; American Community Survey; National Immigration Agency, MOI (Taiwan); National Statistics, Republic of China (Taiwan)
	Immigrants	Total residents born abroad.	

**TABLE A.4: REGIONAL CLASSIFICATION OF COUNTRIES**

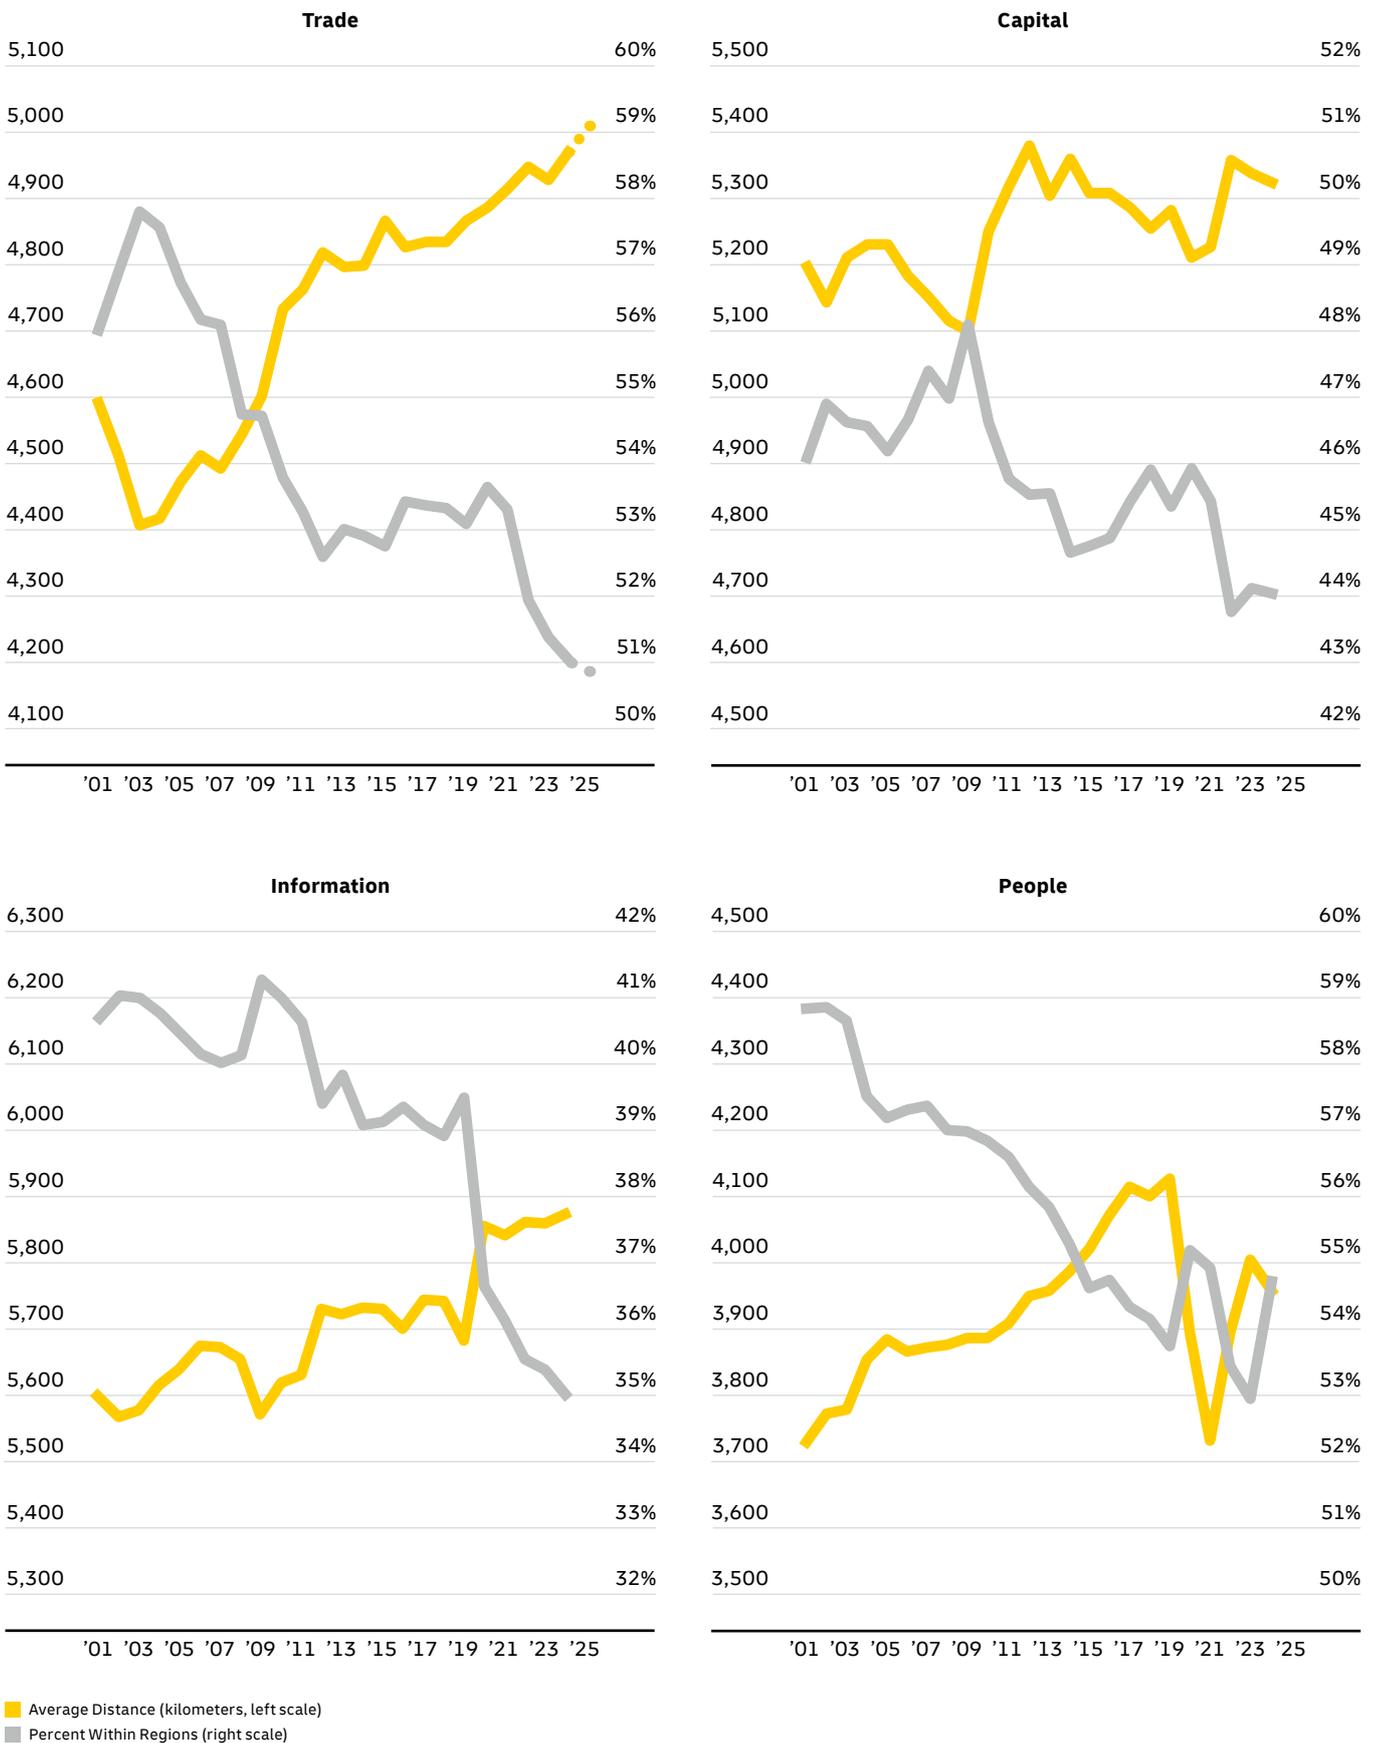

Region	Countries
East Asia & Pacific	Australia; Brunei Darussalam; Cambodia; China; Fiji; Hong Kong SAR, China; Indonesia; Japan; Kiribati; Korea, Republic of; Lao People's Democratic Republic; Macau SAR, China; Malaysia; Mongolia; Myanmar; New Zealand; Papua New Guinea; Philippines; Samoa; Singapore; Solomon Islands; Taiwan, China; Thailand; Timor-Leste; Tonga; Vanuatu; Viet Nam
Europe	Albania; Andorra; Austria; Belarus; Belgium; Bosnia and Herzegovina; Bulgaria; Croatia; Cyprus; Czechia; Denmark; Estonia; Finland; France; Germany; Greece; Hungary; Iceland; Ireland; Italy; Latvia; Lithuania; Luxembourg; Malta; Moldova; Montenegro; Netherlands; North Macedonia; Norway; Poland; Portugal; Romania; Russian Federation; Serbia; Slovakia; Slovenia; Spain; Sweden; Switzerland; Ukraine; United Kingdom
Middle East & North Africa	Algeria; Bahrain; Djibouti; Egypt; Iraq; Israel; Jordan; Kuwait; Lebanon; Libya; Morocco; Oman; Qatar; Saudi Arabia; Syrian Arab Republic; Tunisia; United Arab Emirates; Yemen
North America	Canada; Mexico; United States
South & Central America & the Caribbean	Antigua and Barbuda; Argentina; Bahamas; Barbados; Belize; Bolivia, Plurinational State of; Brazil; Chile; Colombia; Costa Rica; Cuba; Dominica; Dominican Republic; Ecuador; El Salvador; Guatemala; Guyana; Haiti; Honduras; Jamaica; Nicaragua; Panama; Paraguay; Peru; St. Kitts and Nevis; St. Lucia; St. Vincent and the Grenadines; Suriname; Trinidad and Tobago; Uruguay; Venezuela, Bolivarian Republic of
South & Central Asia	Afghanistan; Armenia; Azerbaijan; Bangladesh; Bhutan; Georgia; India; Iran, Islamic Republic of; Kazakhstan; Kyrgyzstan; Maldives; Nepal; Pakistan; Sri Lanka; Tajikistan; Türkiye; Uzbekistan
Sub-Saharan Africa	Angola; Benin; Botswana; Burkina Faso; Burundi; Cabo Verde; Cameroon; Central African Republic; Chad; Congo; Côte d'Ivoire; Democratic Republic of the Congo; Eswatini; Ethiopia; Gabon; Gambia; Ghana; Guinea; Guinea-Bissau; Kenya; Lesotho; Liberia; Madagascar; Malawi; Mali; Mauritania; Mauritius; Mozambique; Namibia; Niger; Nigeria; Rwanda; São Tomé and Príncipe; Senegal; Seychelles; Sierra Leone; South Africa; Sudan; Tanzania, United Republic of; Togo; Uganda; Zambia; Zimbabwe

APPENDIX B

# PILLAR BREADTH TRENDS

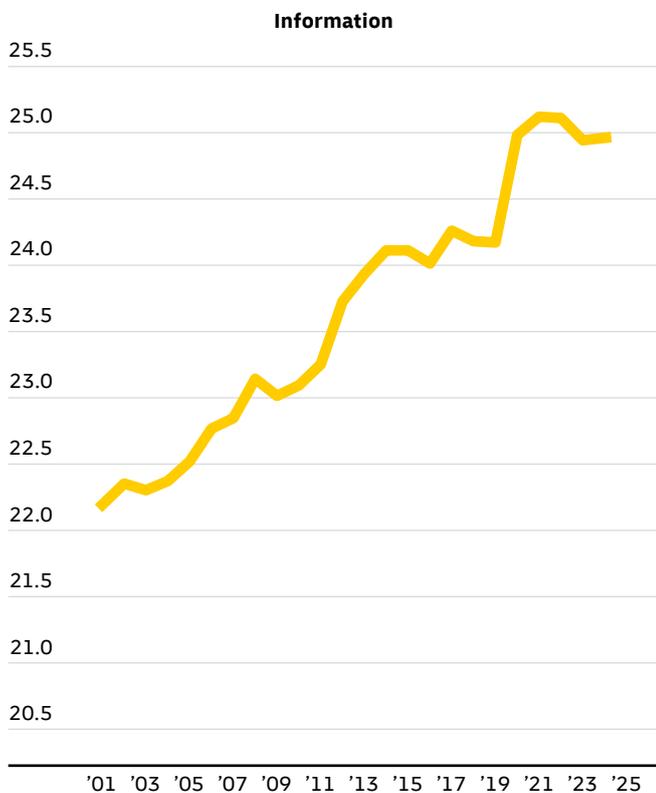

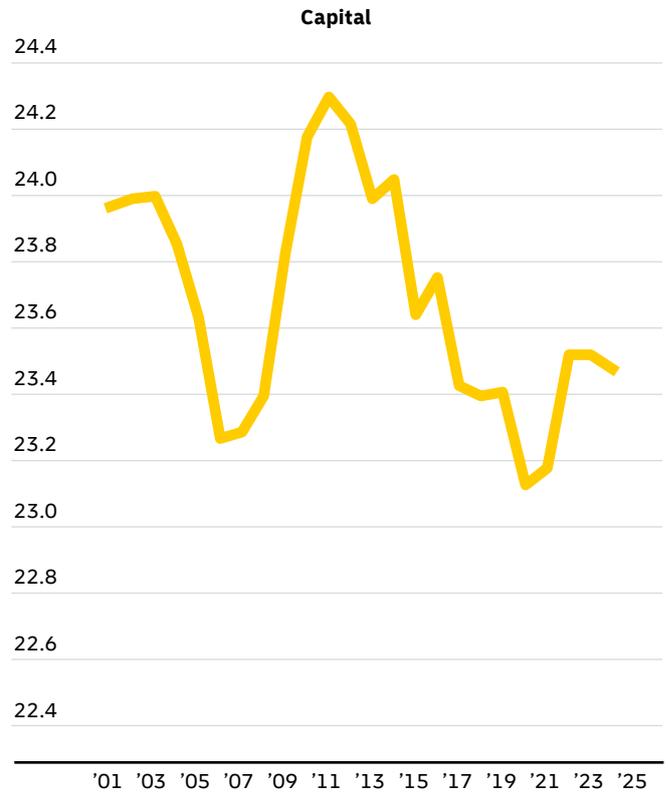

**FIGURE B.1: AVERAGE DISTANCE AND REGIONALIZATION TRENDS, BY PILLAR, 2001 – 2025 (OR MOST RECENT)**

Data sources: Flow data sources listed in Table A.3, CEPII Gravity.  
 Note: Percent intra-regional is based on the region definitions reported in Table A.4. 2025 trade data cover January to September only.

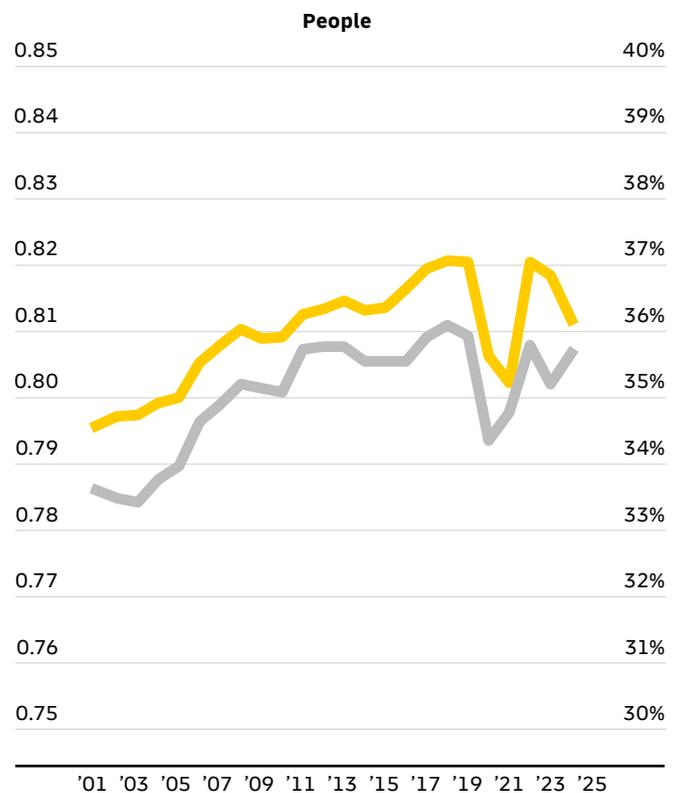

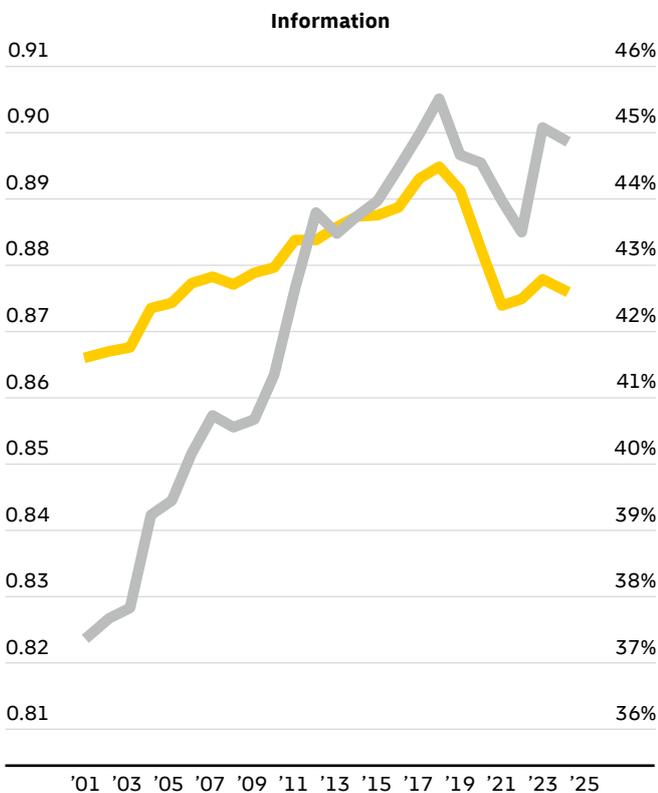

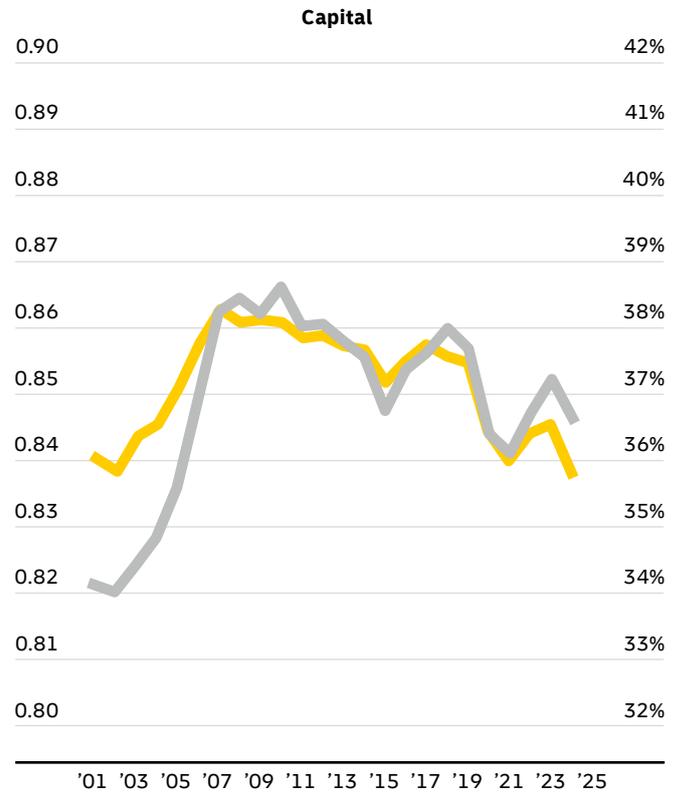

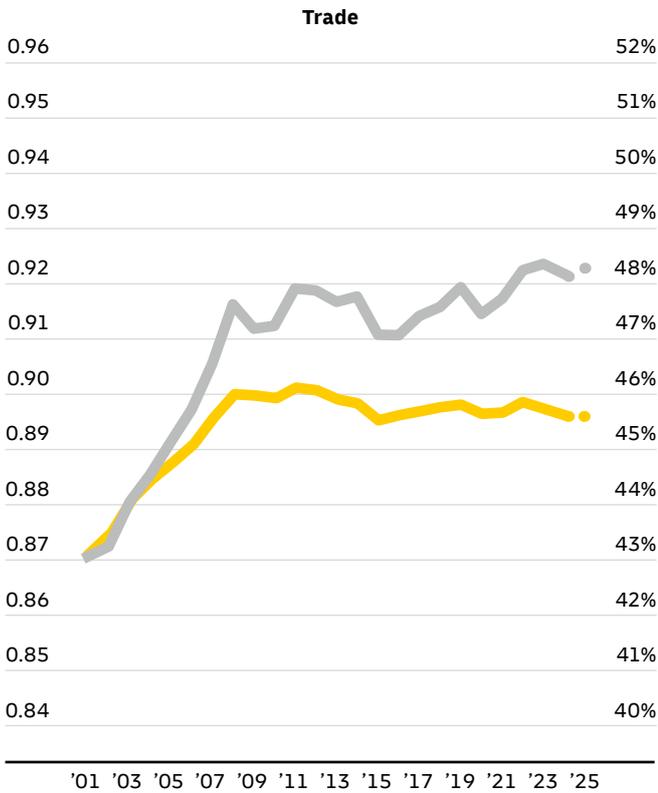

**FIGURE B.2: AVERAGE GEOPOLITICAL DISTANCE TRENDS, BY PILLAR, 2001 – 2025 (OR MOST RECENT)**

■ Average Geopolitical Distance

Data sources: Flow data sources listed in Table A.3, M.A. Bailey, A. Strezhnev & E. Voeten (2017).  
 Note: Geopolitical distance is calculated according to 2019–2023 UN General Assembly votes, rescaled 0–100. 2025 trade data cover January to September only.

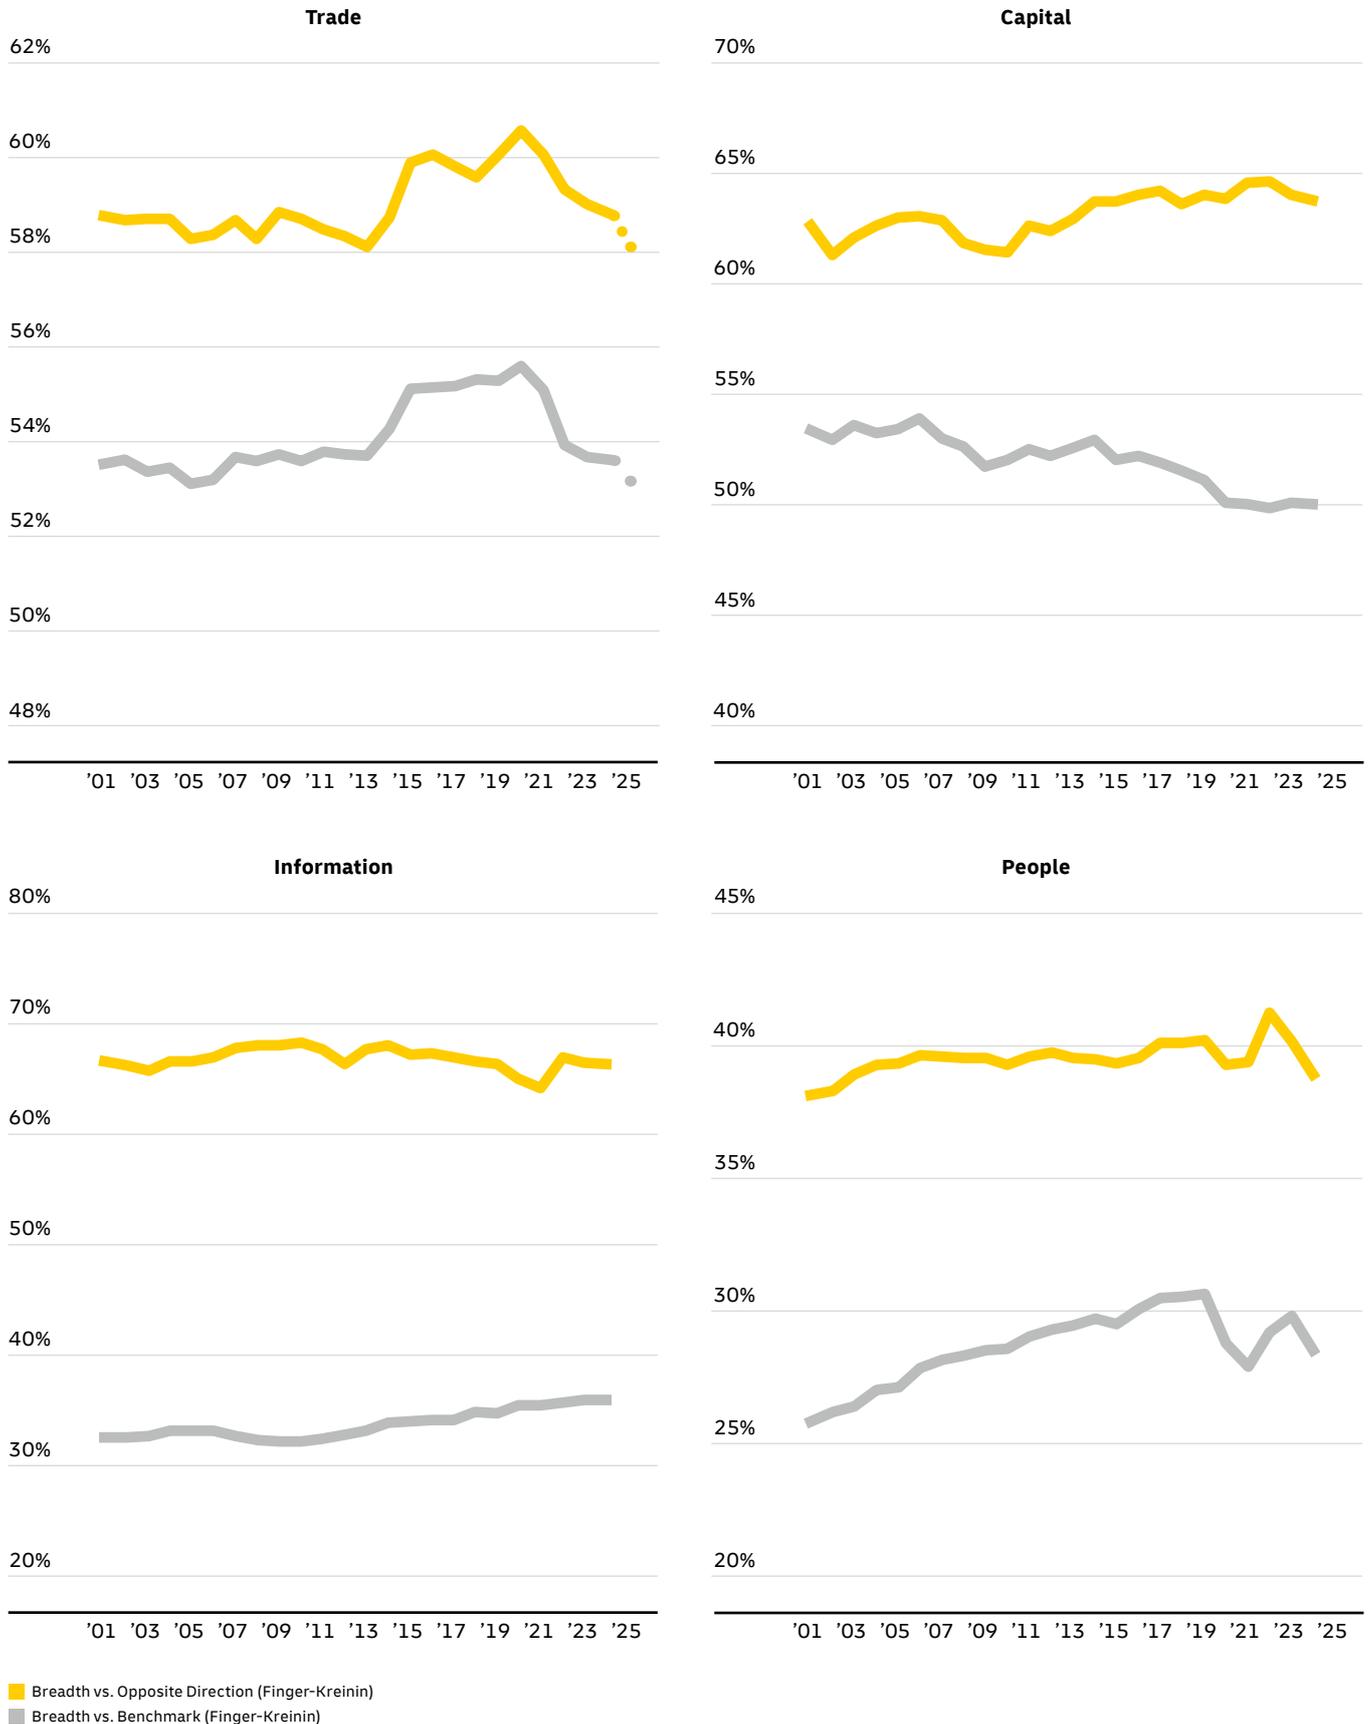

**FIGURE B.3: AVERAGE DIVERSIFICATION TRENDS, BY PILLAR, 2001 – 2025 (OR MOST RECENT)**

■ Diversification Index (1-HHI)  
 ■ Share With Other than Top 5 Partners

Data sources: Flow data sources listed in Table A.3. Note: 2025 trade data cover January to September only.

**FIGURE B.4: AVERAGE BREADTH TRENDS, BY PILLAR, 2001 – 2025 (OR MOST RECENT)**

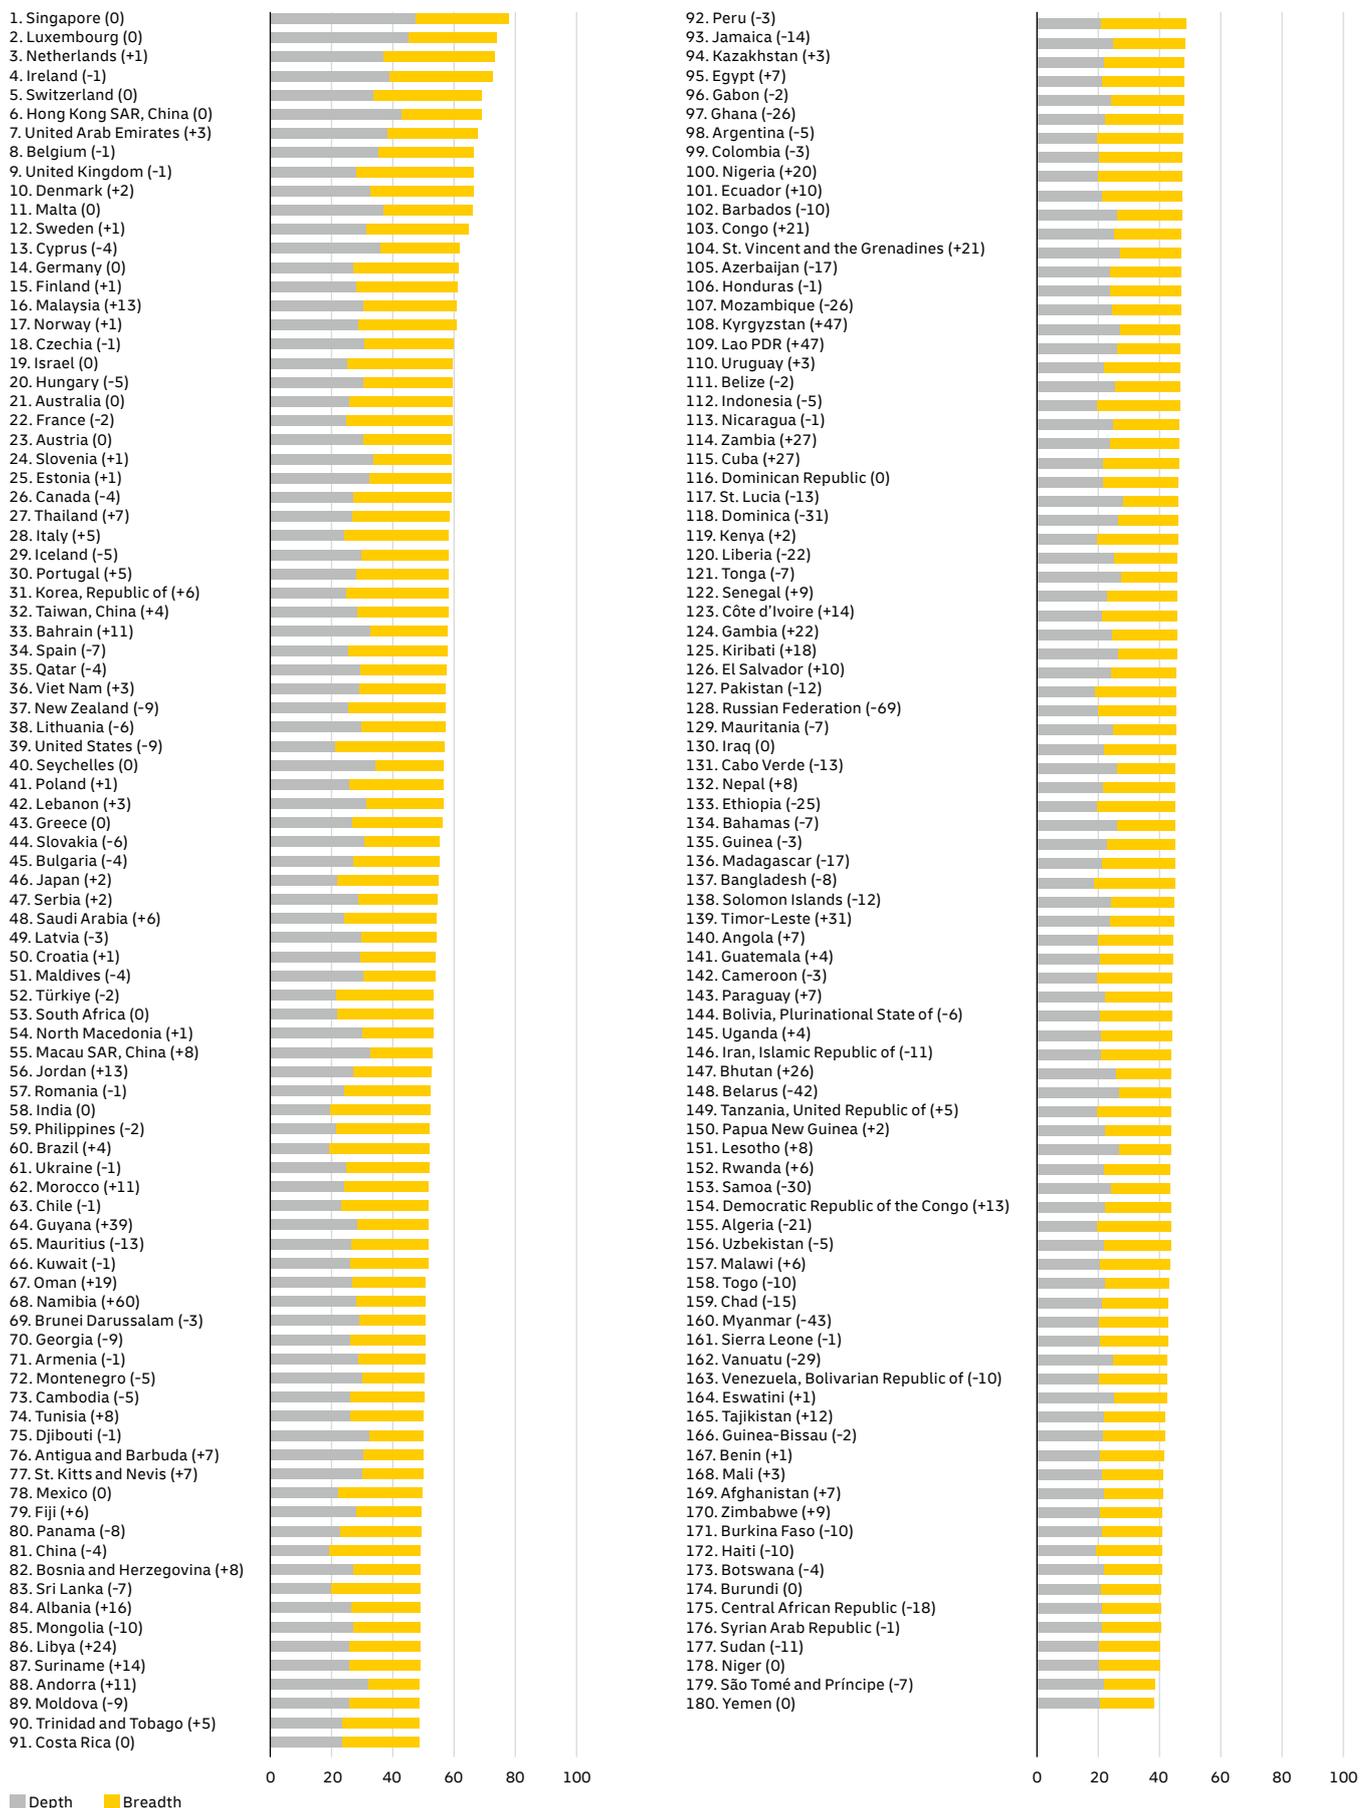

Data sources: Flow data sources listed in Table A.3. Note: Breadth vs. Opposite Direction compares the similarity of each flow's distribution across partner countries to the rest of the world's distribution of the same flow in the opposite direction (e.g., imports for exports). Breadth vs. Benchmark compares the similarity of each flow's geographic distribution across partner countries to the rest of the world's distribution of the benchmark used in the corresponding depth ratio (e.g., GDP for exports). 2025 trade data cover January to September only.

APPENDIX C

# COUNTRY RANKINGS

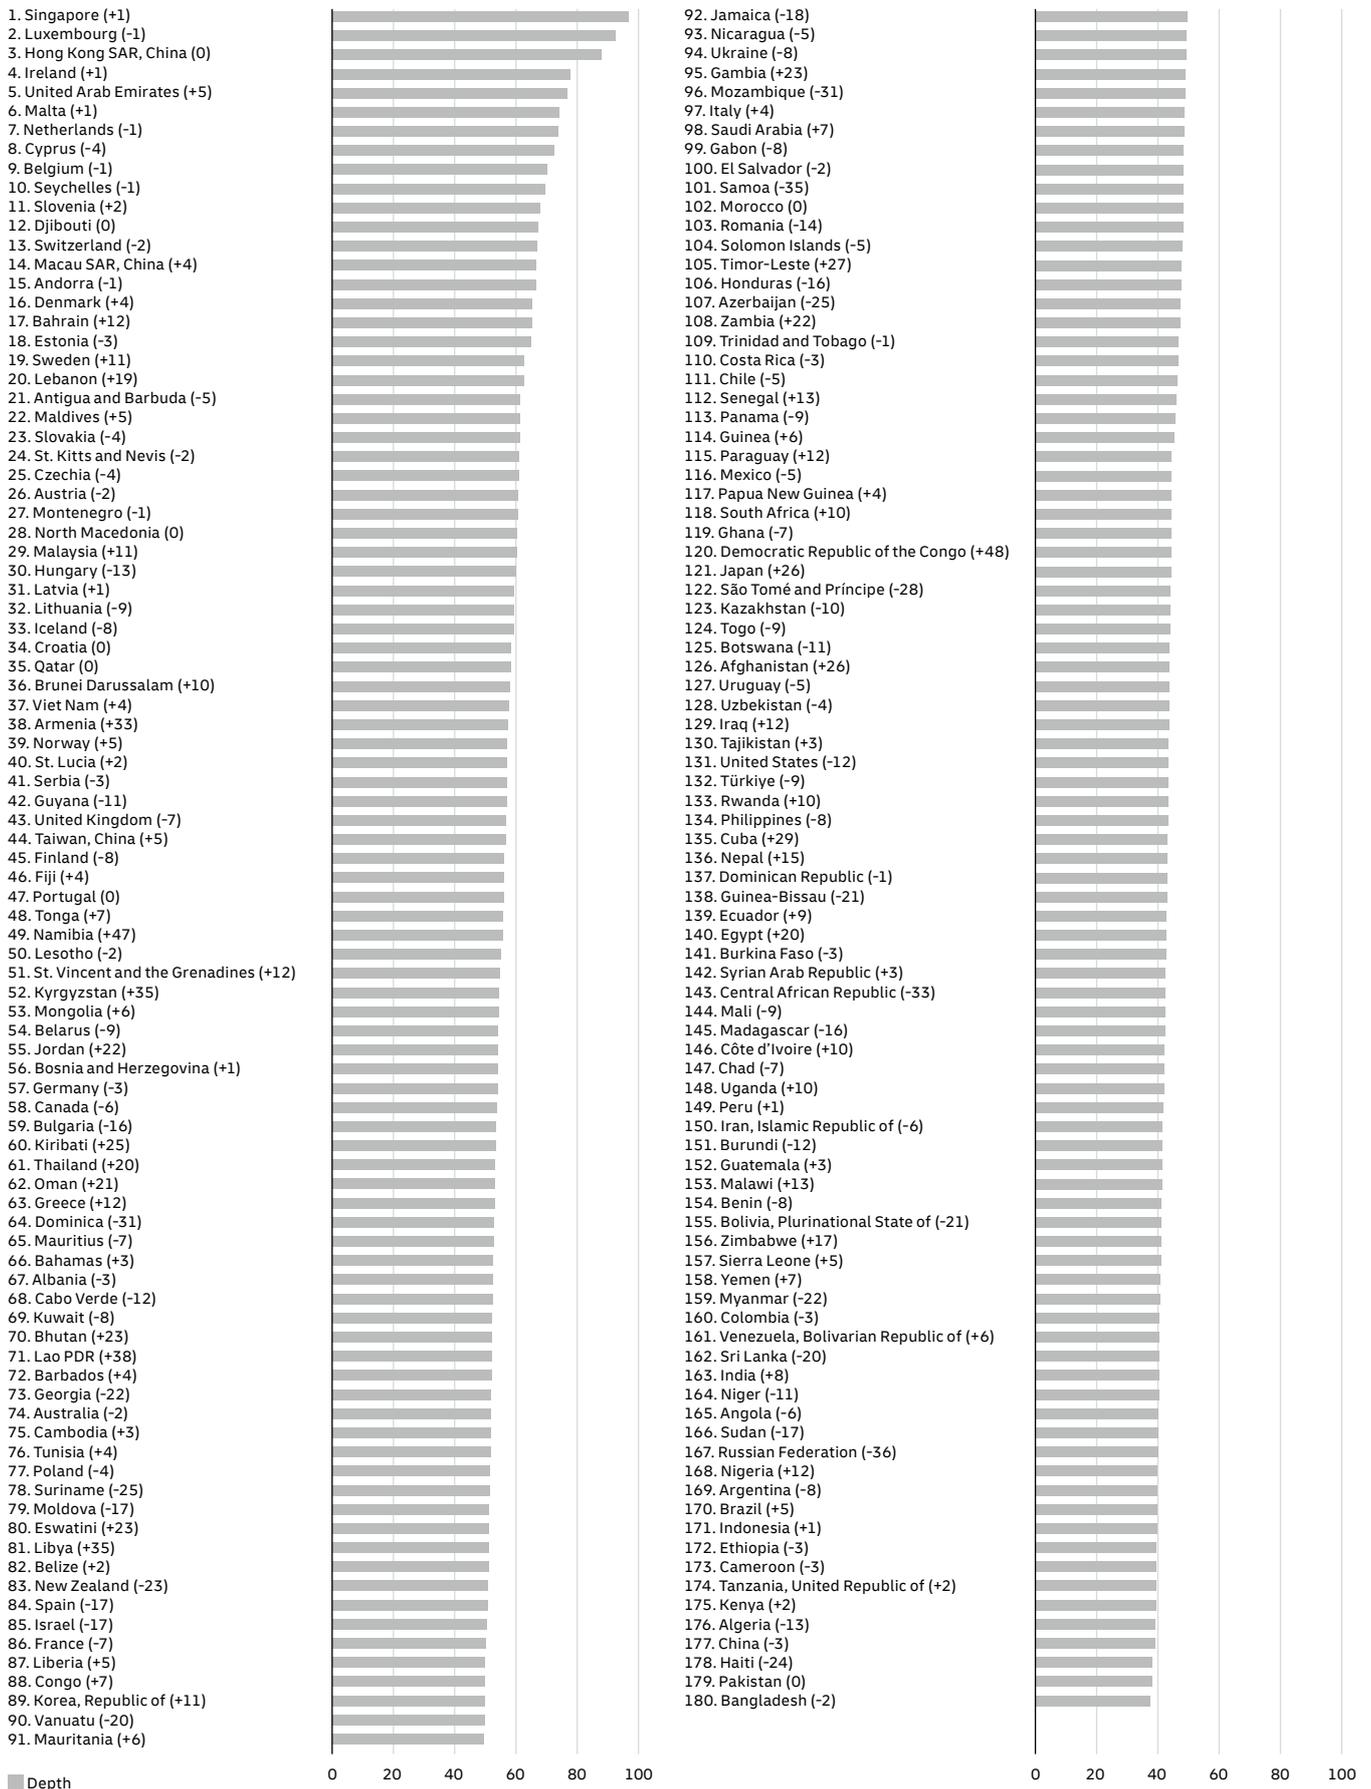

**FIGURE C.1: DHL GLOBAL CONNECTEDNESS INDEX, OVERALL**

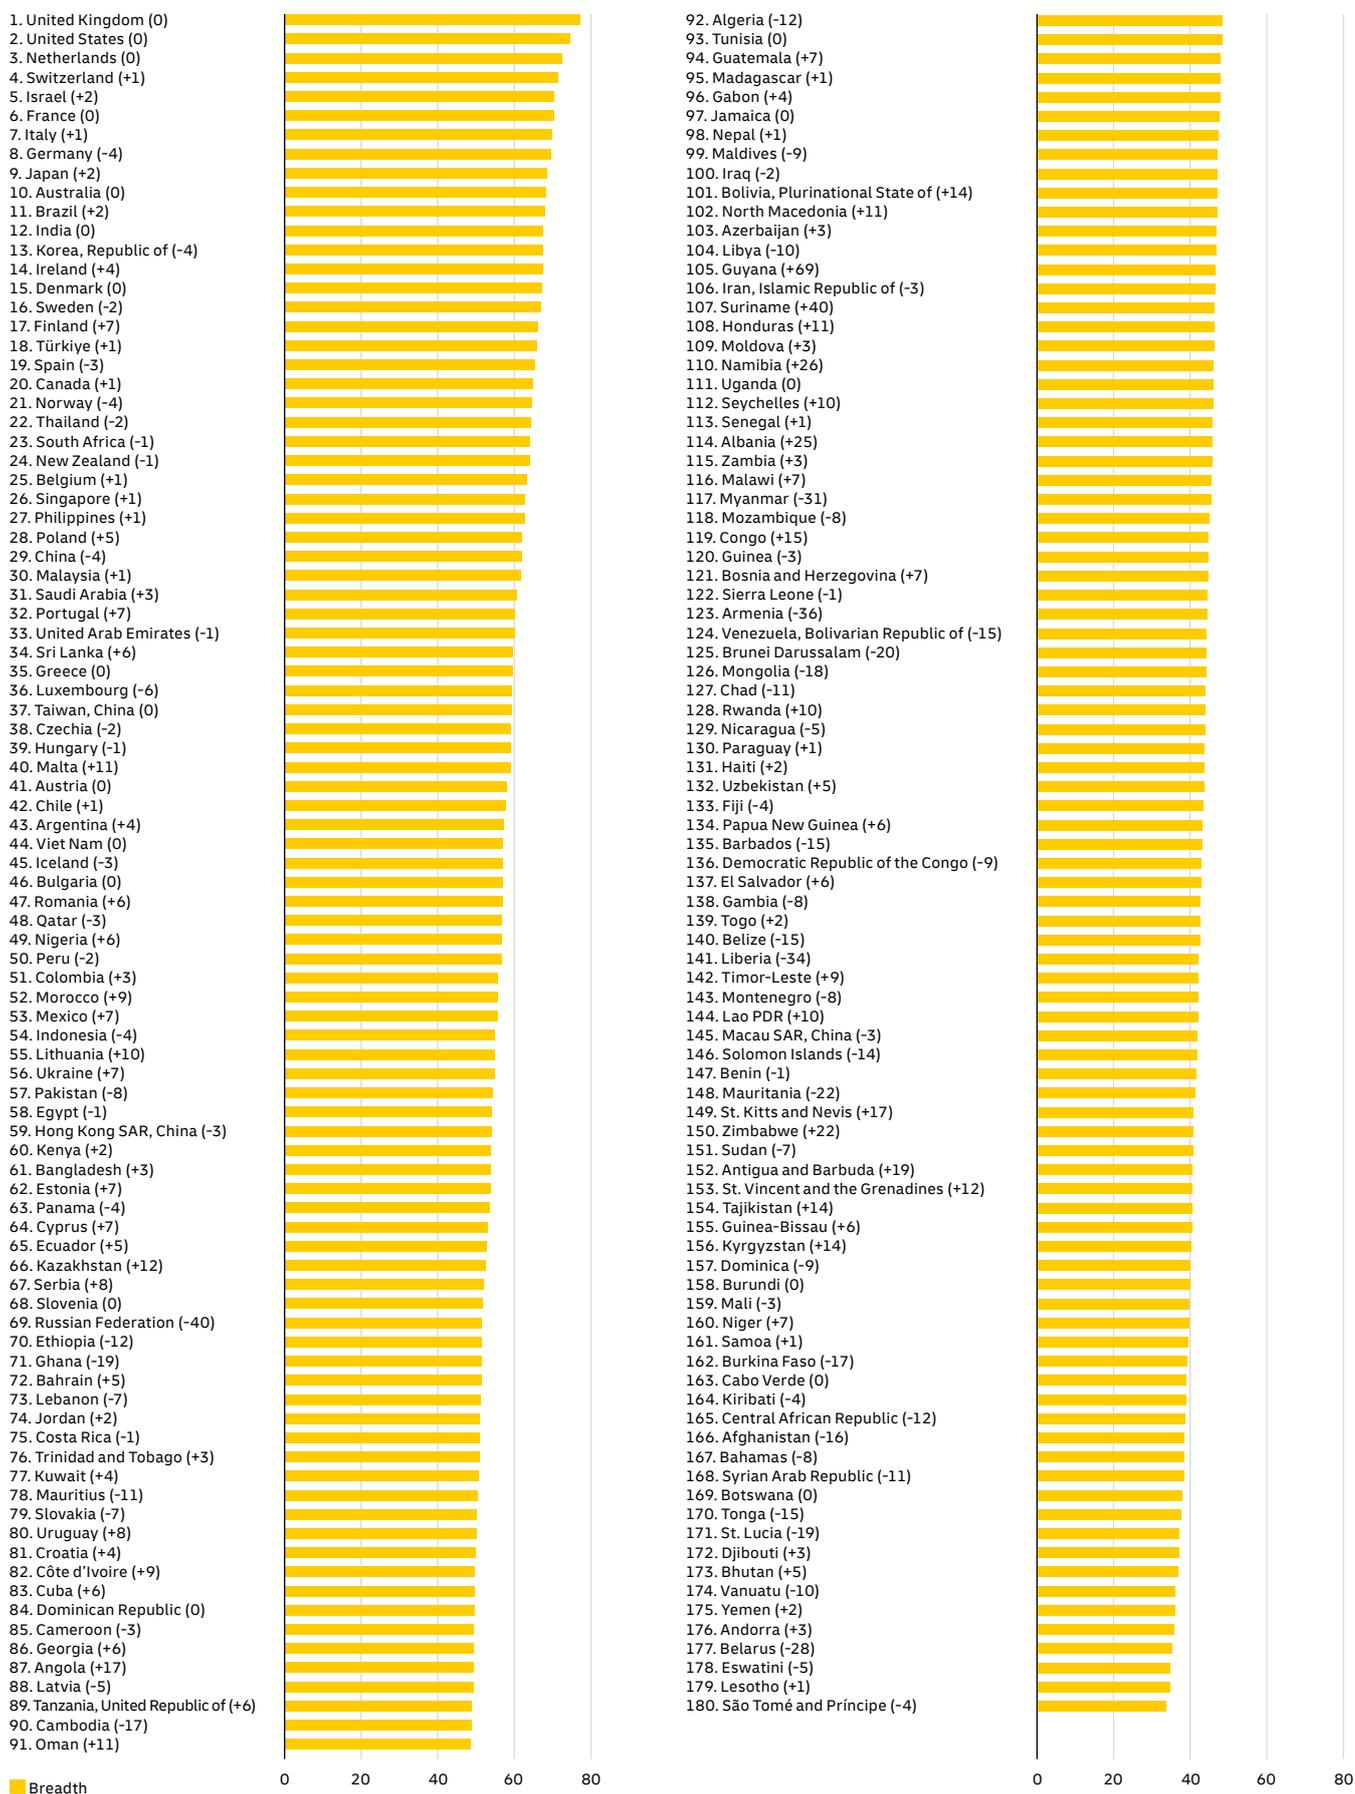

Note: Rank change since 2019 shown in parentheses. Value split between depth and breadth is illustrative only. Overall score is computed as a geometric mean (not a sum) of depth and breadth scores.

FIGURE C.2: DHL GLOBAL CONNECTEDNESS INDEX, DEPTH DIMENSION

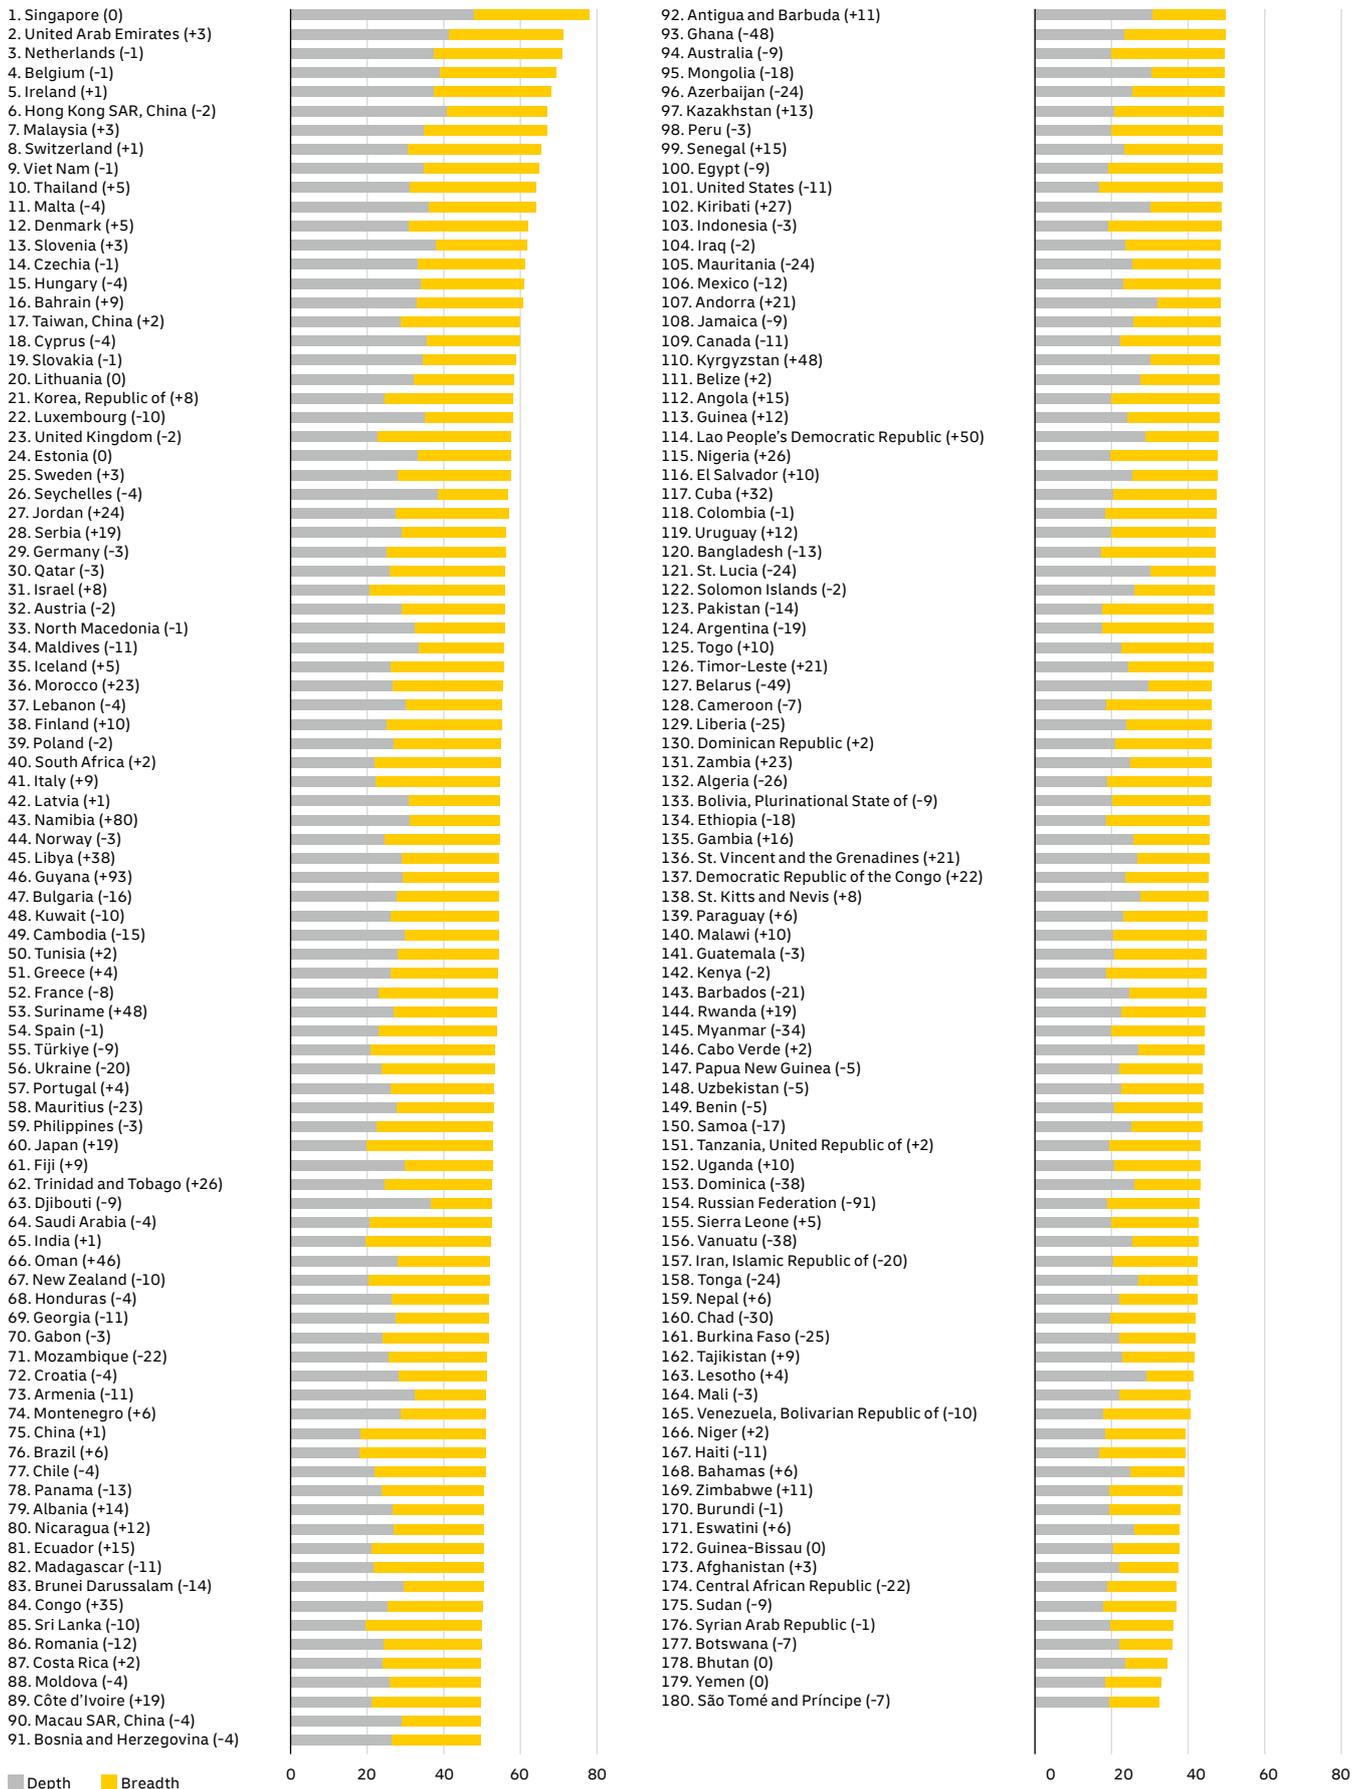

Note: Rank change since 2019 shown in parentheses.

FIGURE C.3: DHL GLOBAL CONNECTEDNESS INDEX, BREADTH DIMENSION

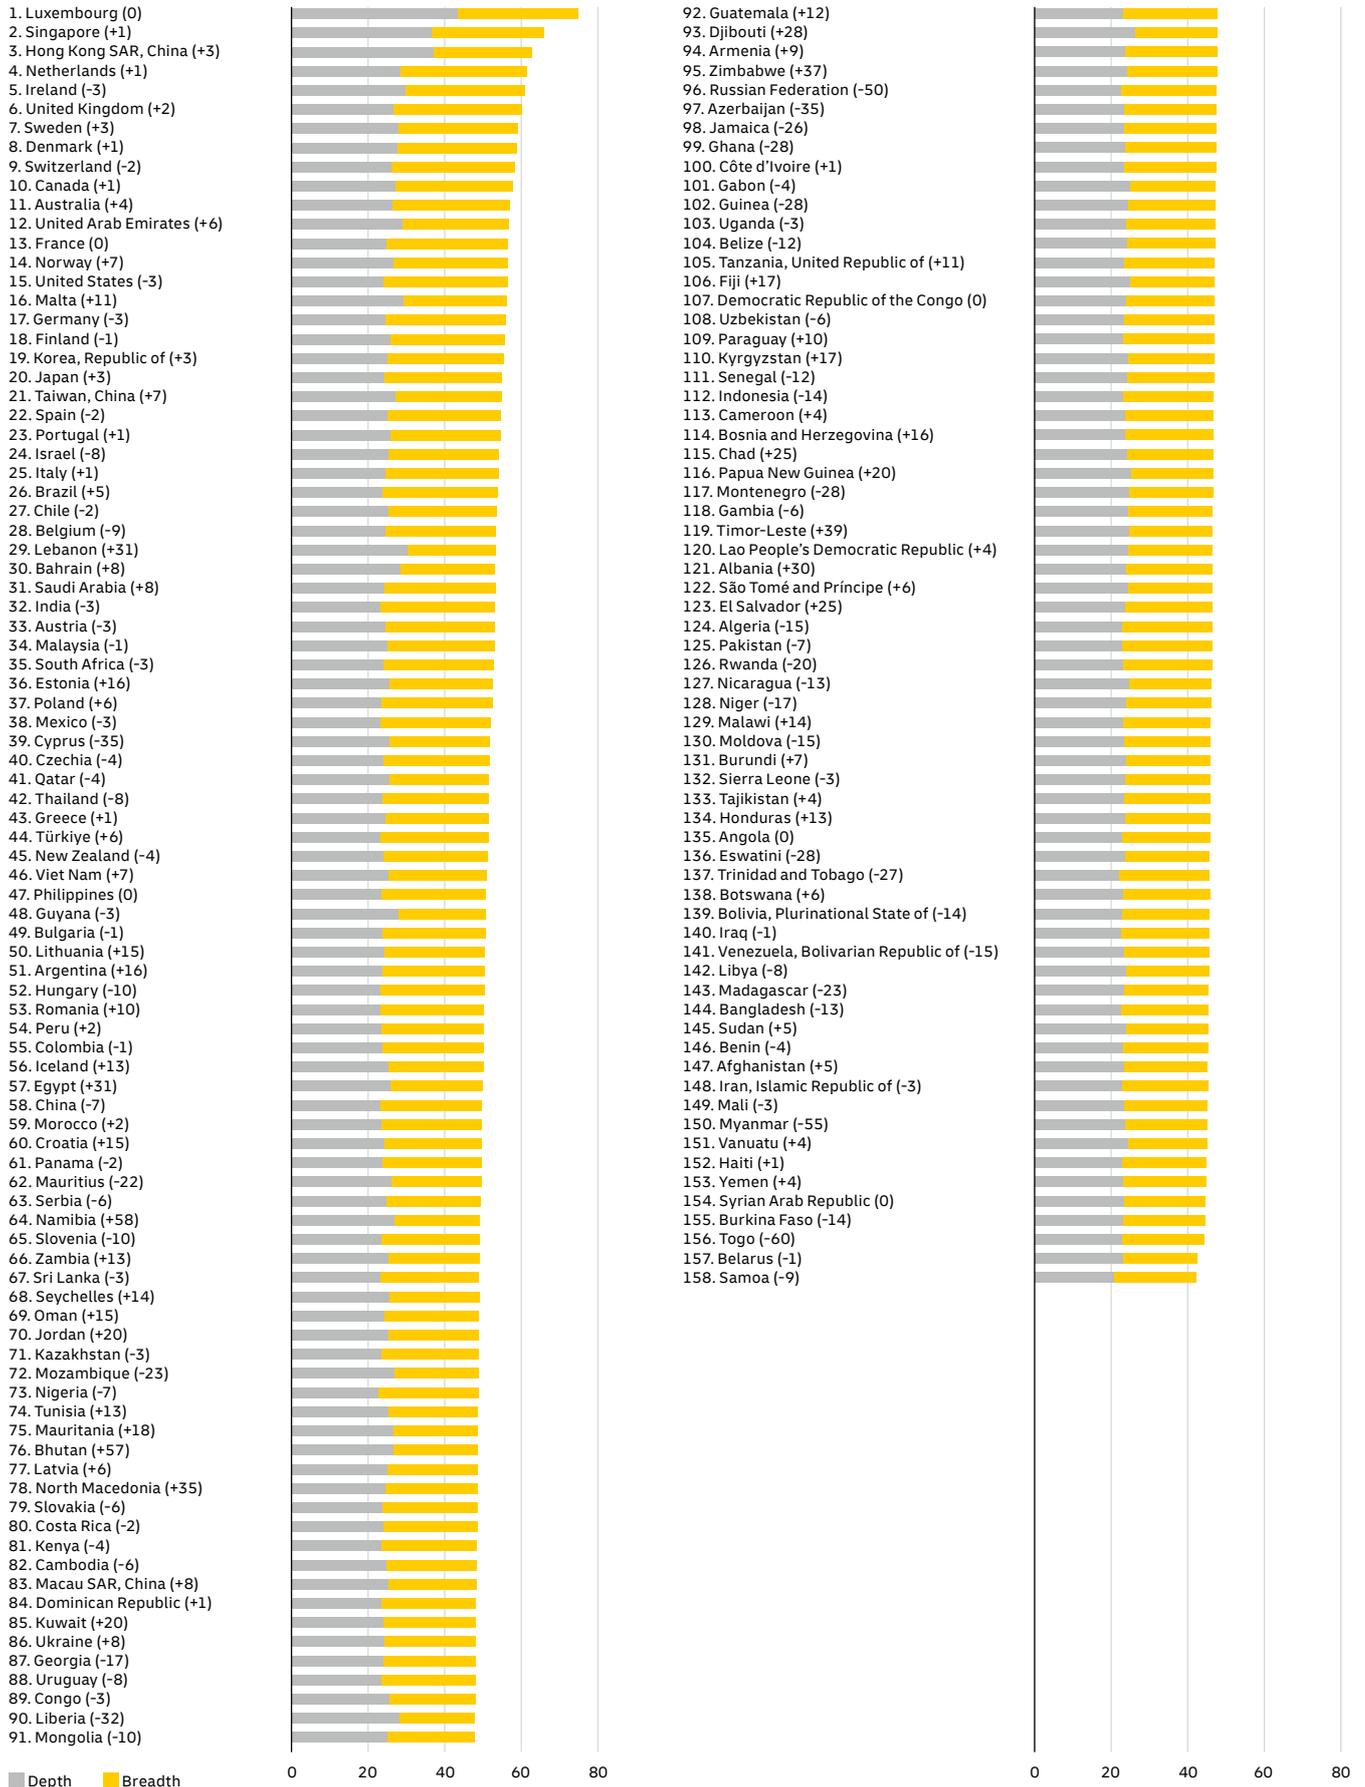

Note: Rank change since 2019 shown in parentheses.

**FIGURE C.4: DHL GLOBAL CONNECTEDNESS INDEX, TRADE PILLAR**

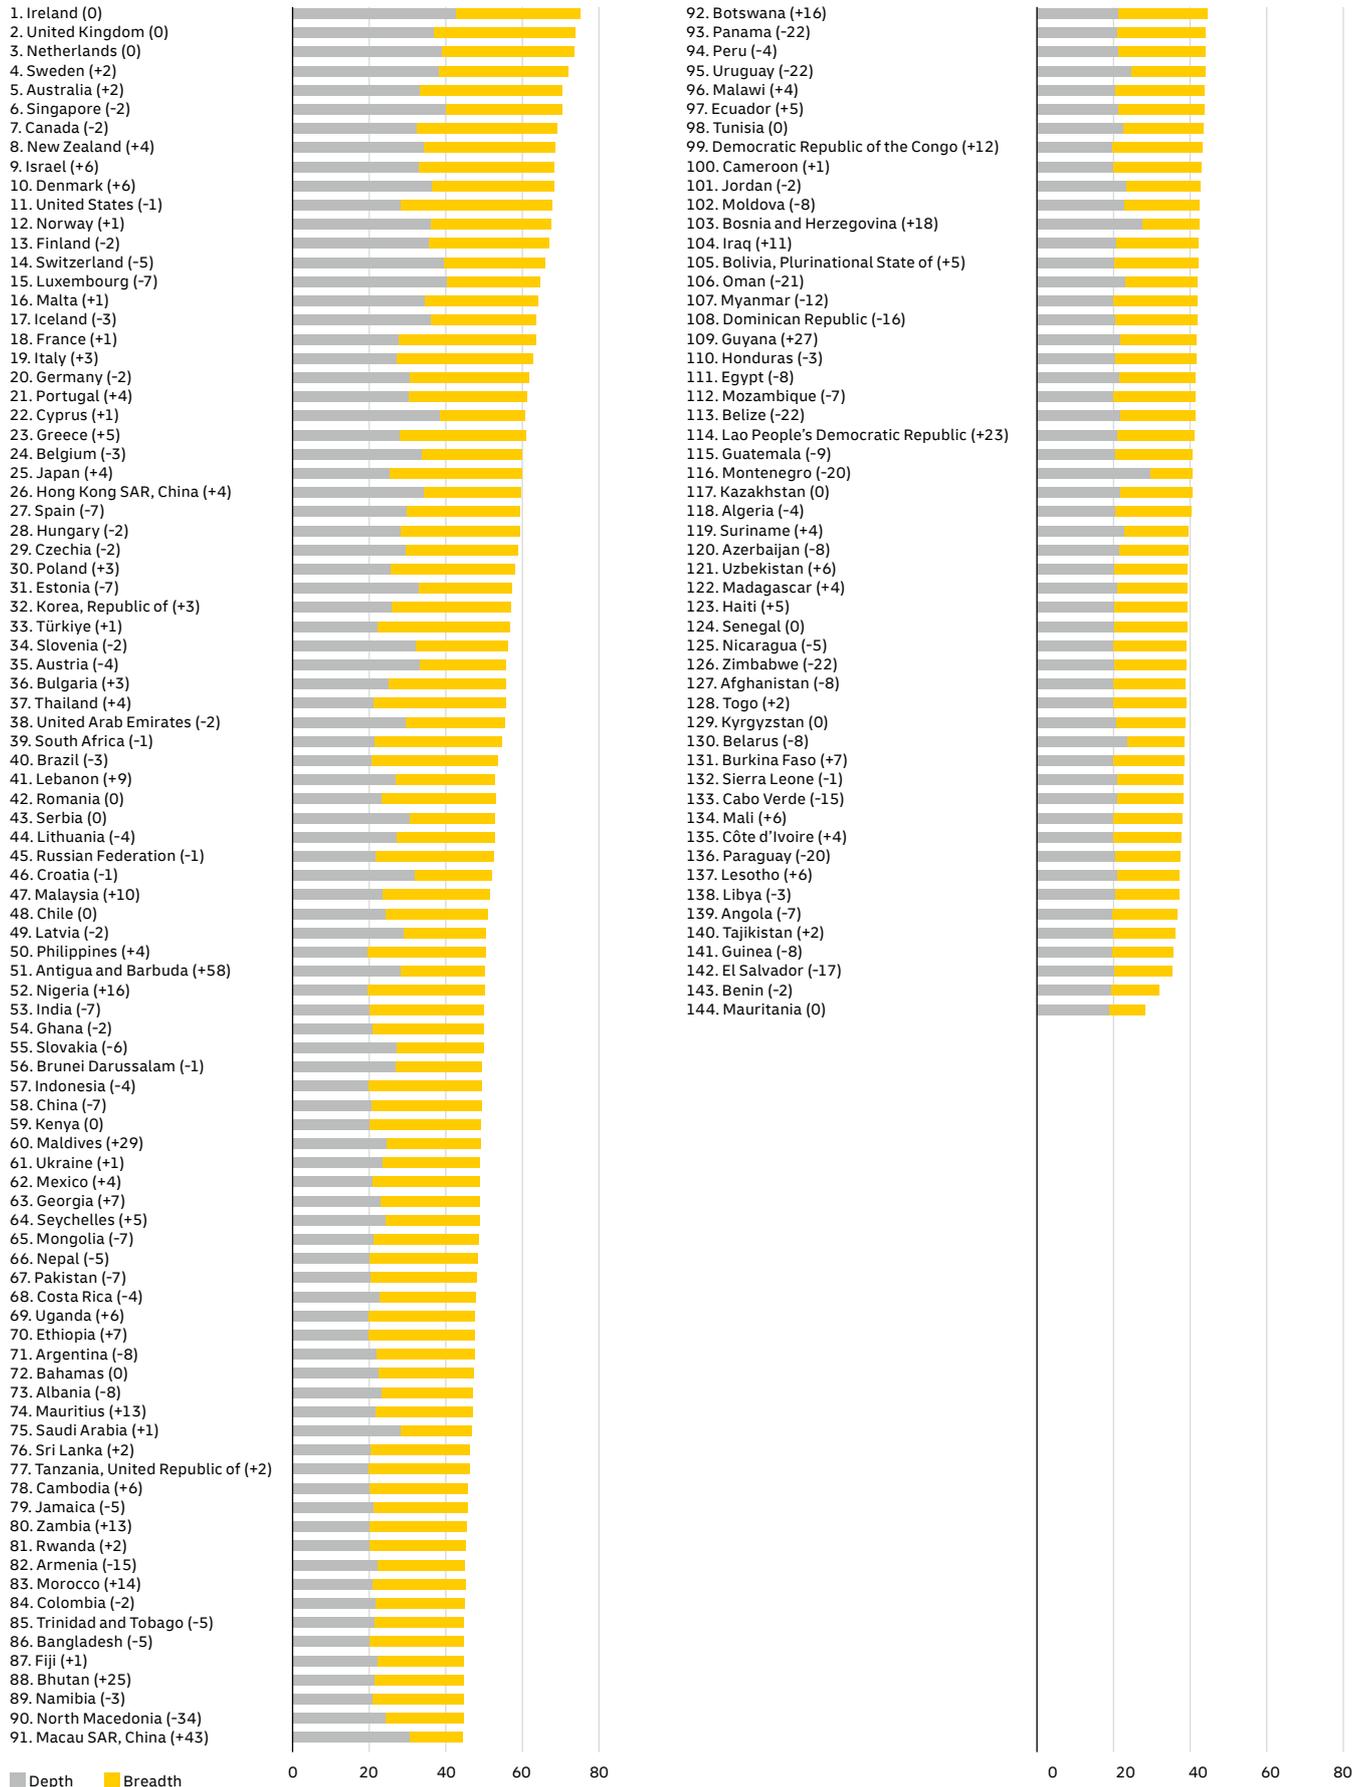

Note: Rank change since 2019 shown in parentheses. Value split between depth and breadth is illustrative only. Overall score is computed as a geometric mean (not a sum) of depth and breadth scores.

**FIGURE C.5: DHL GLOBAL CONNECTEDNESS INDEX, CAPITAL PILLAR**

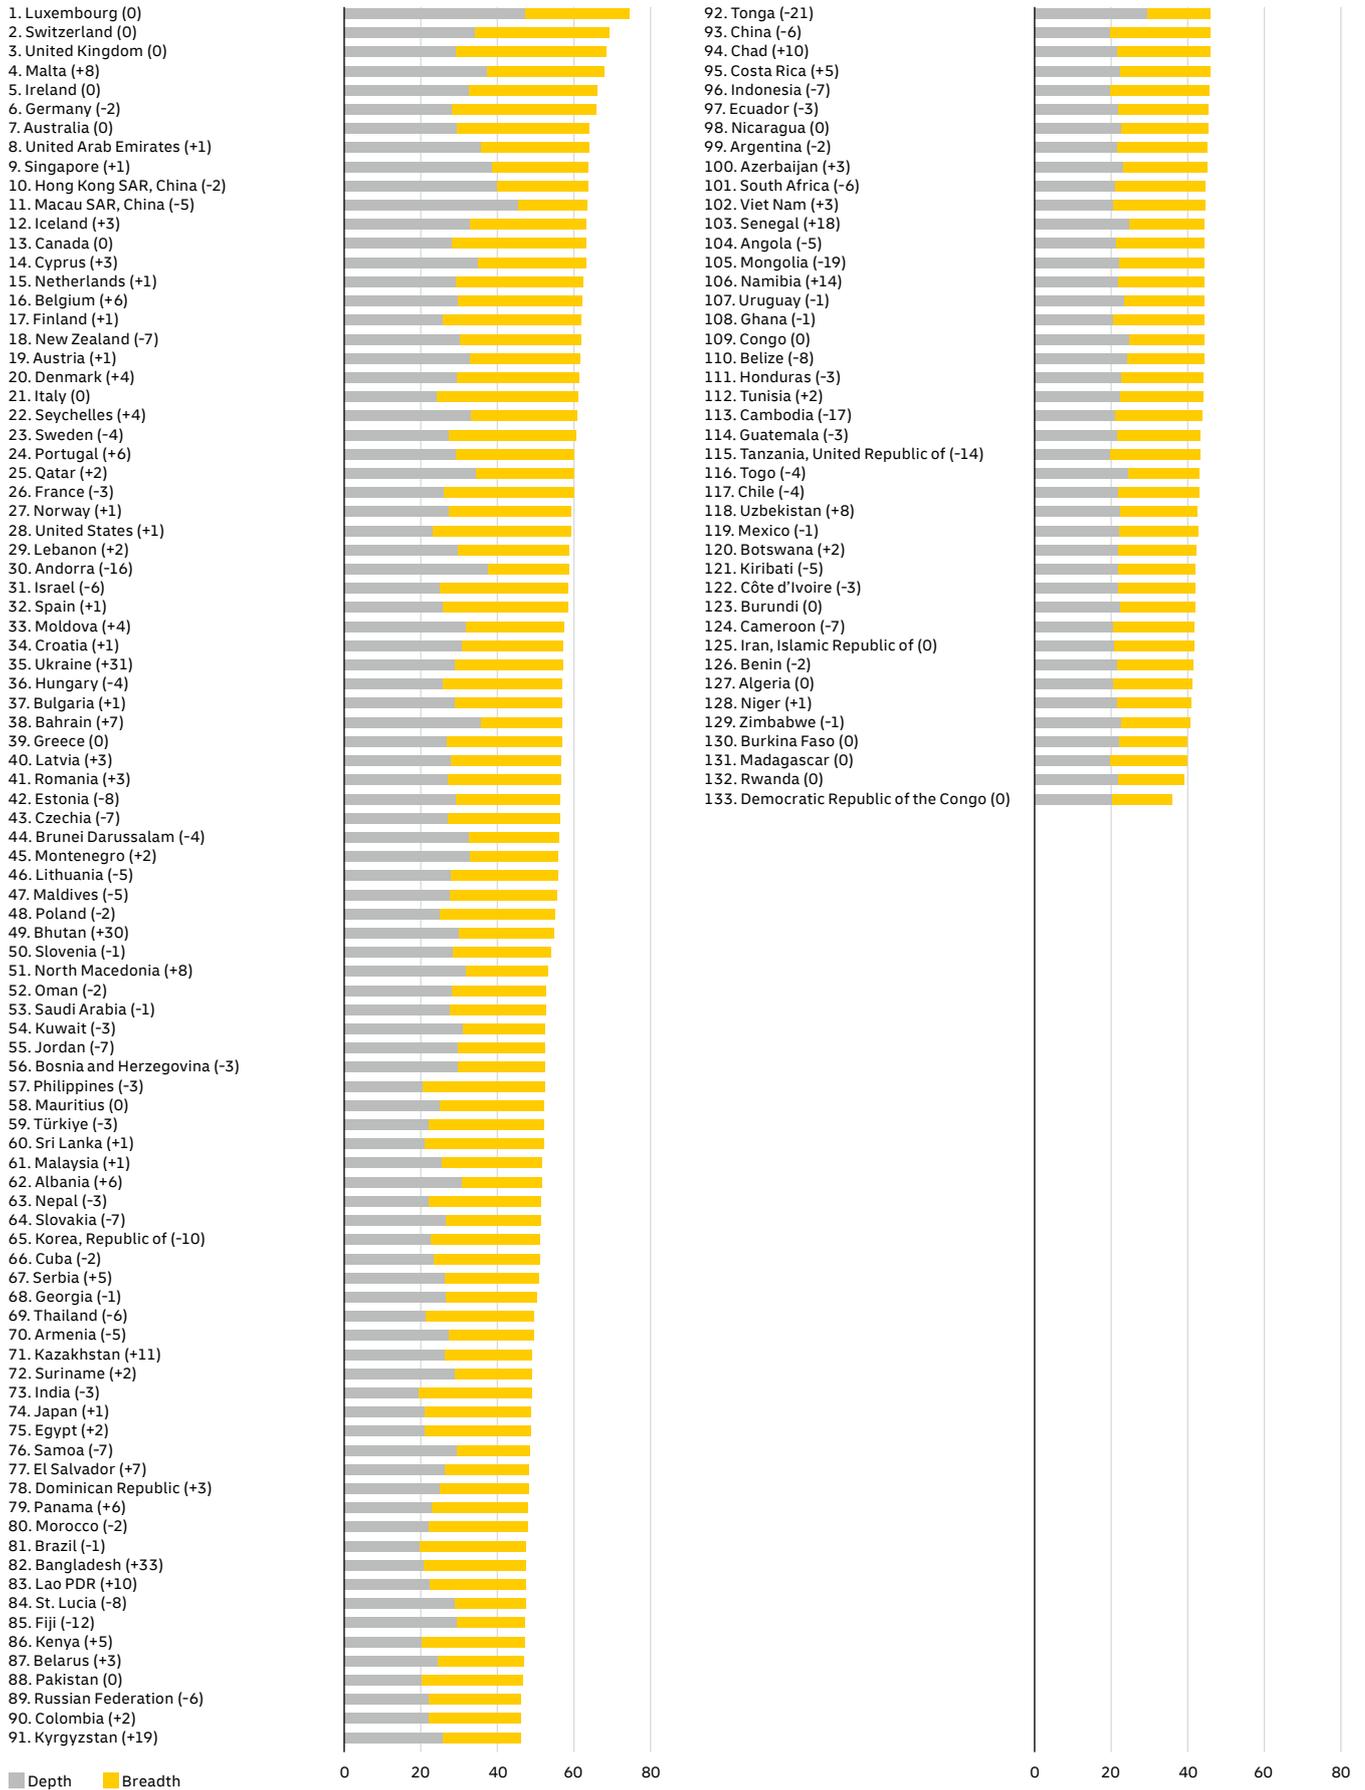

Note: Rank change since 2019 shown in parentheses. Value split between depth and breadth is illustrative only. Overall score is computed as a geometric mean (not a sum) of depth and breadth scores.

**FIGURE C.6: DHL GLOBAL CONNECTEDNESS INDEX, INFORMATION PILLAR**

Note: Rank change since 2019 shown in parentheses. Value split between depth and breadth is illustrative only. Overall score is computed as a geometric mean (not a sum) of depth and breadth scores.

**FIGURE C.7: DHL GLOBAL CONNECTEDNESS INDEX, PEOPLE PILLAR**

Note: Rank change since 2019 shown in parentheses. Value split between depth and breadth is illustrative only. Overall score is computed as a geometric mean (not a sum) of depth and breadth scores.

The **DHL Global Connectedness Report** provides an in-depth analysis of the state of globalization based on more than 9 million data points tracking international trade, capital, information, and people flows. It also ranks 180 countries according to their levels of global connectedness.

 [dhl.com/gcr](https://dhl.com/gcr)

Praise for prior editions of the DHL Global Connectedness Report:

***“The DHL Global Connectedness Index provides an indispensable guide for anyone who is interested in discovering the facts regarding our increasingly entangled world and going beyond the rising rhetoric about globalization.”***

Ian Goldin, Professor of Globalization and Development at the University of Oxford and Founding Director of the Oxford Martin School

The **DHL Trade Atlas** maps and analyzes the evolving landscape of global trade in goods. It highlights shifts in global trade patterns and ranks countries according to the speed and scale of their recent and forecast trade growth.

 [dhl.com/tradeatlas](https://dhl.com/tradeatlas)

Praise for prior editions of the DHL Trade Atlas:

***“This report does a massive public service in grounding the discussion of global ties in facts. It marshals an impressive and diverse array of evidence that effectively rebuts the presumption that globalization is dead. The enduring imperative to trade across borders is affirmed in this data-driven report.”***

Simon J. Evenett, Professor of Geopolitics and Strategy at IMD Business School and Co-Chair of the World Economic Forum’s Global Futures Council on Trade and Investment

The **DHL Global Connectedness Tracker** is a concise report and interactive website that provides regular updates on globalization and global trade. It includes interactive online charts that make it easy for users to explore trends by region, geopolitical alignment, and for individual countries. It also supports easy data and chart downloads for offline use.
