

Case Study: DHL EXPRESS WORLDWIDE

Production and transportation of small-quantity, high-mix medical devices

Unlike consumer goods such as consumer electronics and automobiles, which are mass-produced, medical devices, which are specialized for specific applications, are produced in small lots. Small-lot express shipments are useful in the supply chain for medical devices, which consist of multiple high-value, high-precision components.

- Integrated door-to-door transportation, where the entire transportation process, from pickup to export customs clearance, flight, import customs clearance, and delivery, is performed in-house
- Reduce inventory space and management costs for expensive components and materials by sending the materials you need when you need them
- Online tools support simple and streamlined shipping documentation
- Can be combined with "GoGreen Plus" to reduce greenhouse gas emissions and contribute to the environment
